## Preface

---

The *Handbook of Optical Materials* is a compilation of the physical properties of optical materials used in optical systems and lasers. It contains extensive data tabulations but with a minimum of narration, in a style similar to that of the *CRC Handbook of Chemistry and Physics*. References to original or secondary sources of the data are included throughout. The objective of the handbook is to provide a convenient, reliable source of information on the properties of optical materials.

Data in a handbook of optical materials can be presented by material (e.g., SiO<sub>2</sub>, CaF<sub>2</sub>, Ge), by property (e.g., refractive index, thermal expansion, hardness), by wavelength region (e.g., infrared, visible, ultraviolet), or by application (e.g., transmitting optics, laser hosts, polarizers). In this handbook data are grouped by material properties. Thereby one can compare different materials with respect to their properties and suitability for a particular application.

The volume is divided into sections devoted to various forms of condensed matter (crystals, glasses, polymers, metals), liquids, and gases. Within each section physical properties, linear and nonlinear optical properties, and many special properties such as electrooptic, magneto-optic, and elasto-optic properties of the materials are tabulated. The optical solids included are mainly inorganic materials; optical liquids are mainly organic substances.

If by an optical material one means a material that exhibits some optical property such as transmission, absorption, reflection, refraction, scattering, etc., the number of materials to be considered becomes unmanageable. Thus the inclusion of materials in this volume is selective rather than exhaustive. In the case of commercial optical glasses, for example, properties of representative types of glasses are given but not properties for all compositional variations. Glasses with special properties or for special applications are included, however.

Bulk materials rather than thin films and multilayer structures are considered. Although optical glasses epitomizes an engineered material, other engineered optical materials such as nanomaterials, quantum wells, or photonic crystals are also not included (although one of the last is listed in Appendix II).

Although today optics can encompass x-ray and millimeterwave optics, coverage is limited to materials for the spectral range from the vacuum ultraviolet (~100 nm) to the infrared (up to 100  $\mu$ m) portion of the electromagnetic spectrum.

Among optical materials and properties not treated explicitly are photorefractive materials, liquid crystals, optical fibers, phase-change optical recording materials, luminescent materials (phosphors, scintillators), optical damage, and materials preparation and fabrication.

Much of the numerical data in this handbook is from Volumes III, IV, V, and Supplement 2 of the *CRC Handbook of Laser Science and Technology*. These volumes should be consulted for more detailed descriptions of properties and their measurement (the contents of the volumes and the contributors are given in the following pages). In many instances the data in these volumes have been reformatted and combined with additions and recent developments. Several new sections have been added. For example, gases can play various roles as

an optical material—as transmitting media, active media for Faraday rotation, frequency conversion, filter, and phase conjugation. Physical and optical properties of a selected number of gases are therefore included in a final section.

The discovery of new optical materials has been accompanied by a somewhat bewildering and befuddling proliferation of abbreviations and acronyms. An appendix has been added to decode several hundred of these terms. Common or mineralogical names for optical materials are also included. Methods of preparing optical materials and thin films have developed their own terminology; many of these abbreviations are given in another appendix.

This volume has benefited from the efforts of many contributors to the *CRC Handbook of Laser Science and Technology* series. I am indebted to them for what in many cases have been very extensive compilations. In the course of preparing this volume I have also benefited from other input provided by Mark Davis, Alexander Marker, Lisa Moore, John Myers, and Charlene Smith; these are gratefully acknowledged. Finally, I appreciate the excellent help provided by Project Editors Samar Haddad and Joette Lynch, Production Supervisor Helena Redshaw, and the staff of the CRC Press in the process of preparing this handbook.

Marvin J. Weber  
Danville, California

## The Author

---

**Marvin John Weber** received his education at the University of California, Berkeley, and was awarded the A.B., M.A., and Ph.D. degrees in physics. After graduation, Dr. Weber continued as a postdoctoral Research Associate and then joined the Research Division of the Raytheon Company where he was a Principal Scientist working in the areas of spectroscopy and quantum electronics. As Manager of Solid State Lasers, his group developed many new laser materials including rare-earth-doped yttrium orthoaluminate. While at Raytheon, he also discovered luminescence in bismuth germanate, a scintillator crystal widely used for the detection of high energy particles and radiation.

During 1966 to 1967, Dr. Weber was a Visiting Research Associate with Professor Arthur Schawlow's group in the Department of Physics, Stanford University.

In 1973, Dr. Weber joined the Laser Program at the Lawrence Livermore National Laboratory. As Head of Basic Materials Research and Assistant Program Leader, he was responsible for the physics and characterization of optical materials for high-power laser systems used in inertial confinement fusion research. From 1983 to 1985, he accepted a transfer assignment with the Office of Basic Energy Sciences of the U.S. Department of Energy in Washington, DC, where he was involved with planning for advanced synchrotron radiation facilities and for atomistic computer simulations of materials. Dr. Weber returned to the Chemistry and Materials Science Department at LLNL in 1986 and served as Associate Division Leader for condensed matter research and as spokesperson for the University of California/National Laboratories research facilities at the Stanford Synchrotron Radiation Laboratory. He retired from LLNL in 1993 and is at present a staff scientist in the Department of Nuclear Medicine and Functional Imaging of the Life Sciences Division at the Lawrence Berkeley National Laboratory.

Dr. Weber is Editor-in-Chief of the multi-volume *CRC Handbook Series of Laser Science and Technology*. He has also served as Regional Editor for the *Journal of Non-Crystalline Solids*, as Associate Editor for the *Journal of Luminescence* and the *Journal of Optical Materials*, and as a member of the International Editorial Advisory Boards of the Russian journals *Fizika i Khimiya Stekla* (Glass Physics and Chemistry) and *Kvantovaya Elektronika* (Quantum Electronics).

Among several honors he has received are an Industrial Research IR-100 Award for research and development of fluorophosphate laser glass, the George W. Morey Award of the American Ceramics Society for his basic studies of fluorescence, stimulated emission, and the atomic structure of glass, and the International Conference on Luminescence Prize for his research on the dynamic processes affecting luminescence efficiency and the application of this knowledge to laser and scintillator materials.

Dr. Weber is a Fellow of the American Physical Society, the Optical Society of America, and the American Ceramics Society and a member of the Materials Research Society.

*Contents of previous volumes on optical materials from the*  
**CRC HANDBOOK OF LASER SCIENCE AND TECHNOLOGY**

**VOLUME III: OPTICAL MATERIALS**

**PART 1: NONLINEAR OPTICAL PROPERTIES/RADIATION DAMAGE**

**SECTION 1: NONLINEAR OPTICAL PROPERTIES**

- 1.1 Nonlinear and Harmonic Generation Materials — Shobha Singh
- 1.2 Two-Photon Absorption — Walter L. Smith
- 1.3 Nonlinear Refractive Index — Walter L. Smith
- 1.4 Stimulated Raman Scattering — Fred Milanovich

**SECTION 2: RADIATION DAMAGE**

- 2.1 Introduction — Richard T. Williams and E. Joseph Friebele
- 2.2 Crystals — Richard T. Williams
- 2.3 Glasses — E. Joseph Friebele

**VOLUME IV: OPTICAL MATERIALS**

**PART 2: PROPERTIES**

**SECTION 1: FUNDAMENTAL PROPERTIES**

- 1.1 Transmitting Materials
  - 1.1.1 Crystals — Perry A. Miles, Marilyn J. Dodge, Stanley S. Ballard, James S. Browder, Albert Feldman, and Marvin J. Weber
  - 1.1.2 Glasses — James W. Fleming
  - 1.1.3 Plastics — Monis Manning
- 1.2 Filter Materials — Lee M. Cook and Stanley E. Stokowski
- 1.3 Mirror and Reflector Materials — David W. Lynch
- 1.4 Polarizer Materials — Jean M. Bennett and Ann T. Glassman

**SECTION 2: SPECIAL PROPERTIES**

- 2.1 Linear Electro-Optic Materials — Ivan P. Kaminow
- 2.2 Magneto-Optic Materials — Di Chen
- 2.3 Elasto-Optic Materials — Milton Gottlieb
- 2.4 Photorefractive Materials — Peter Günter
- 2.5 Liquid Crystals — Stephen D. Jacobs

**VOLUME V: OPTICAL MATERIALS**

**PART 3: APPLICATIONS, COATINGS, AND FABRICATION**

**SECTION 1: APPLICATIONS**

- 1.1 Optical Waveguide Materials — Peter L. Bocko and John R. Gannon
- 1.2 Materials for High Density Optical Data Storage — Alan E. Bell
- 1.3 Holographic Parameters and Recording Materials — K. S. Pennington
- 1.4 Phase Conjugation Materials — Robert A. Fisher
- 1.5 Laser Crystals — Charles F. Rapp
- 1.7 Infrared Quantum Counter Materials — Leon Esterowitz

**SECTION 2: THIN FILMS AND COATINGS**

- 2.1 Multilayer Dielectric Coatings — Verne R. Costich
- 2.2 Graded-Index Surfaces and Films — W. Howard Lowdermilk

**SECTION 3: OPTICAL MATERIALS FABRICATION**

- 3.1 Fabrications Techniques — G. M. Sanger and S. D. Fantone
- 3.2 Fabrication Procedures for Specific Materials — G. M. Sanger and S. D. Fantone

## **SUPPLEMENT 2: OPTICAL MATERIALS**

SECTION 1. OPTICAL CRYSTALS — Bruce H. T. Chai

SECTION 2. OPTICAL GLASSES — James W Fleming

SECTION 3. OPTICAL PLASTICS — Donald Keyes

SECTION 4. OPTICAL LIQUIDS — Robert Sacher and William Sacher

SECTION 5. FILTER MATERIALS — Lee M. Cook

SECTION 6. LINEAR ELECTROOPTIC MATERIALS — William R. Holland and  
Ivan P. Kaminow

SECTION 7. NONLINEAR OPTICAL MATERIALS

7.1 Crystals — Shobha Singh

7.2 Cluster-Insulator Composite Materials — Joseph H. Simmons,  
Barrett G. Potter, Jr., and O. Romulo Ochoa

SECTION 8. NONLINEAR OPTICAL PROPERTIES

8.1 Nonlinear Refractive Index :

Inorganic Materials — Lloyd Chase and Eric W. Van Stryland

Organic Materials — Anthony F. Garito and Mark Kuzyk

8.2 Two-Photon Absorption:

Inorganic Materials — Lloyd Chase and Eric W. Van Stryland

Organic Materials — Anthony F. Garito and Mark Kuzyk

8.3 Stimulated Raman and Brillouin Scattering — John F. Reintjes

SECTION 9. MAGNETOOPTIC MATERIALS

9.1 Crystals and Glasses — Merritt N. Deeter, Gordon W. Day, and  
Allen H. Rose

9.2 Organic and Inorganic Liquids — Egberto Munin

SECTION 10. ELASTOOPTIC MATERIALS — M. Gottlieb and N. B. Singh

SECTION 11. PHOTOREFRACTIVE MATERIALS — Carolina Medrano  
and Peter Günter

SECTION 12. OPTICAL PHASE CONJUGATION MATERIALS — David M. Pepper,  
Marvin Klein, Monica Minden, Hans Brusselbach

SECTION 13. GRADIENT INDEX MATERIALS — Duncan T. Moore

SECTION 14. LIQUID CRYSTALS — Stephen D. Jacobs, Kenneth L. Marshall,  
and Ansgar Schmid

SECTION 15. DIAMOND OPTICS — Albert Feldman

SECTION 16. LASER CRYSTALS — David S. Sumida and Barry A. Wechsler

SECTION 17. LASER GLASSES

17.1 Bulk Glasses — Charles F. Rapp

17.2 Waveguide Glasses — Steven T. Davey, B. James Ainslie, and Richard Wyatt

SECTION 18. OPTICAL WAVEGUIDE MATERIALS

18.1 Crystals — Patricia A. Morris Hotsenpiller

18.2 Glasses — Allen J. Bruce

18.3 Plastic Optical Fibers — Lee L. Blyler, Jr.

SECTION 19. OPTICAL COATINGS FOR HIGH POWER LASERS — Mark R.  
Kozlowski, Robert Chow, and Ian M. Thomas

APPENDIX 1. ABBREVIATIONS, ACRONYMS, INITIALISMS, AND  
MINERALOGICAL OR COMMON NAMES FOR OPTICAL MATERIALS

APPENDIX 2. ABBREVIATIONS FOR METHODS OF PREPARING  
OPTICAL MATERIALS

APPENDIX 3. DESIGNATIONS OF RUSSIAN OPTICAL GLASSES  
Leonid B. Glebov and Mikhail N. Tolstoi

# Table of Contents

---

## SECTION 1: CRYSTALLINE MATERIALS

- 1.1 Introduction
- 1.2 Physical Properties
  - 1.2.1 Isotropic Crystals
  - 1.2.2 Uniaxial Crystals
  - 1.2.3 Biaxial Crystals
- 1.3 Optical Properties
  - 1.3.1 Isotropic Crystals
  - 1.3.2 Uniaxial Crystals
  - 1.3.3 Biaxial Crystals
  - 1.3.4 Dispersion Formulas for Refractive Index
  - 1.3.5 Thermooptic Coefficients
- 1.4 Mechanical Properties
  - 1.4.1 Elastic Constants
  - 1.4.2 Elastic Moduli
  - 1.4.3 Engineering Data
- 1.5 Thermal Properties
  - 1.5.1 Melting Point, Heat Capacity, Thermal Expansion, Conductivity
  - 1.5.2 Temperature Dependence of Heat Capacity for Selected Solids
  - 1.5.3 Debye Temperature
- 1.6 Magneto optic Properties
  - 1.6.1 Diamagnetic Crystals
  - 1.6.2 Paramagnetic Crystals
  - 1.6.3 Ferromagnetic, Antiferromagnetic, and Ferrimagnetic Crystals
- 1.7 Electro optic Properties
  - 1.7.1 Linear Electro optic Coefficients
  - 1.7.2 Quadratic Electro optic Materials
- 1.8 Elastooptic Properties
  - 1.8.1 Elastooptic Coefficients
  - 1.8.2 Acoustooptic Materials
- 1.9 Nonlinear Optical Properties
  - 1.9.1 Nonlinear Refractive Index
  - 1.9.2 Two-Photon Absorption
  - 1.9.3 Second Harmonic Generation Coefficients
  - 1.9.4 Third-Order Nonlinear Optical Coefficients
  - 1.9.5 Optical Phase Conjugation Materials

## SECTION 2: GLASSES

- 2.1 Introduction
- 2.2 Commercial Optical Glasses
  - 2.2.1 Optical Properties
  - 2.2.2 Internal Transmittance
  - 2.2.3 Mechanical Properties
  - 2.2.4 Thermal Properties
- 2.3 Specialty Optical Glasses

- 2.3.1 Optical Properties
- 2.3.2 Mechanical Properties
- 2.3.3 Thermal Properties
- 2.4 Fused Silica
- 2.5 Fluoride Glasses
  - 2.5.1 Fluorozirconate Glasses
  - 2.5.2 Fluorohafnate Glasses
  - 2.5.3 Other Fluoride Glasses
- 2.6 Chalcogenide Glasses
- 2.7 Magneto optic Properties
  - 2.7.1 Diamagnetic Glasses
  - 2.7.2 Paramagnetic Glasses
- 2.8 Electro optic Properties
- 2.9 Elastooptic Properties
- 2.10 Nonlinear Optical Properties
  - 2.10.1 Nonlinear Refractive Index
  - 2.10.2 Two-Photon Absorption
  - 2.10.3 Third-Order Nonlinear Optical Coefficients
  - 2.10.4 Brillouin Phase Conjugation
- 2.11 Special Glasses
  - 2.11.1 Filter Glasses
  - 2.11.2 Laser Glasses
  - 2.11.3 Faraday Rotator Glasses
  - 2.11.4 Gradient-Index Glasses
  - 2.11.5 Mirror Substrate Glasses
  - 2.11.6 Athermal Glasses
  - 2.11.7 Acoustooptic Glasses
  - 2.11.8 Abnormal Dispersion Glasses

## SECTION 3: POLYMERIC MATERIALS

- 3.1 Optical Plastics
- 3.2 Index of Refraction
- 3.3 Nonlinear Optical Properties
- 3.4 Thermal Properties
- 3.5 Engineering Data

## SECTION 4: METALS

- 4.1 Physical Properties of Selected Metals
- 4.2 Optical Properties
- 4.3 Mechanical Properties
- 4.4 Thermal Properties
- 4.5 Mirror Substrate Materials

## SECTION 5: LIQUIDS

- 5.1 Introduction
- 5.2 Water
  - 5.2.1 Physical Properties
  - 5.2.2 Absorption

- 5.2.3 Index of Refraction
- 5.3 Physical Properties of Selected Liquids
  - 5.3.1 Thermal Conductivity
  - 5.3.2 Viscosity
  - 5.3.3 Surface Tension
  - 5.3.4 Absorption
- 5.4 Index of Refraction
  - 5.4.1 Organic Liquids
  - 5.4.2 Inorganic Liquids
  - 5.4.3 Calibration Liquids
  - 5.4.4 Abnormal Dispersion Liquids
- 5.5 Nonlinear Optical Properties
  - 5.5.1 Two-Photon Absorption Cross Sections
  - 5.5.2 Nonlinear Refraction
  - 5.5.3 Kerr Constants
  - 5.5.4 Third-Order Nonlinear Optical Coefficients
  - 5.5.5 Stimulated Raman Scattering
  - 5.5.6 Stimulated Brillouin Scattering
- 5.6 Magneto-optic Properties
  - 5.6.1 Verdet Constants of Inorganic Liquids
  - 5.6.2 Verdet Constants of Organic Liquids
  - 5.6.3 Dispersion of Verdet Constants
- 5.7 Commercial Optical Liquids

## SECTION 6: GASES

- 6.1 Introduction
- 6.2 Physical Properties of Selected Gases
- 6.3 Index of Refraction
- 6.4 Nonlinear Optical Properties
  - 6.4.1 Nonlinear Refractive Index
  - 6.4.2 Two-Photon Absorption
  - 6.4.3 Third-Order Nonlinear Optical Coefficients
  - 6.4.4 Stimulated Raman Scattering
  - 6.4.5 Brillouin Phase Conjugation
- 6.5 Magneto-optic Properties
- 6.6 Atomic Resonance Filters

## APPENDICES

- Appendix I Safe Handling of Optical Materials
- Appendix II Abbreviations, Acronyms, Initialisms, and Mineralogical or Common Names of Optical Materials
- Appendix III Abbreviations for Methods of Preparing Optical Materials and Thin Films
- Appendix IV Fundamental Physical Constants
- Appendix V Units and Conversion Factors

# *Section 1: Crystalline Materials*

- 1.1 Introduction
- 1.2 Physical Properties
- 1.3 Optical Properties
- 1.4 Mechanical Properties
- 1.5 Thermal Properties
- 1.6 Magneto-optic Properties
- 1.7 Electro-optic Properties
- 1.8 Elastooptic Properties
- 1.9 Nonlinear Optical Properties

## Section 1

### CRYSTALLINE MATERIALS

#### 1.1 Introduction\*

Crystalline materials included in this section are insulators and semiconductors that have a transparent region within the range from the vacuum ultraviolet (from  $\sim 100$  nm) to the infrared (up to  $100\text{ }\mu\text{m}$ ) portion of the electromagnetic spectrum. Crystals with wide band gaps are transparent from the ultraviolet through the visible region; crystals with a narrower band gap may appear opaque but are transparent in the infrared region. Using this broad transparency definition of optical crystals, virtually all known crystals can be included. Coverage, however, is limited to those crystals which either occur in nature or are produced in the laboratory for optical use or with potential for such use. For this reason hydrate or hydroxide crystals are generally excluded because they are thermally less stable and have limited transmission range due to OH absorption. Highly hygroscopic materials are also excluded because of the obvious difficulty of handling, unless they have already been used, such as urea, KDP, CD\*A, etc. Only pure compounds are considered. Compounds containing elements having intrinsic absorptions due to incompletely filled d or f shell electrons are also avoided.

Other critical issues for the use of optical crystals are solid-state phase transitions that occur as a function of both temperature and pressure and polymorphism. Compounds that have a very small stability field or serious phase transition problems have limited use as optical materials. Phase change and decomposition temperatures of crystals are noted in Section 1.5 on thermal properties. Generally only the thermodynamically stable structure at room temperature and pressure are listed in this section. Compounds that have naturally occurring polymorphic forms are included, however, e.g.,  $\text{CaCO}_3$ ,  $\text{TiO}_2$ , and aluminum silicate  $\text{Al}_2\text{SiO}_5$ . In other cases, only the stable phase is listed, e.g., quartz ( $\alpha\text{-SiO}_2$ ).

Many compounds were considered appropriate as entries of optical crystals in Sections 1.1–1.3 regardless of the amount of information available. As Chai\* has noted, merely showing the existence of a compound with its chemical constituents can help to estimate the stability of its isomorphs and the structural tolerance of doping or other modifications. Most of the basic material properties such as optical transparency and refractive indices of an unstudied compound can be estimated with reasonable accuracy based on its better studied isomorphs that have measured properties listed in the tables.

Optical crystals in Sections 1.1–1.3 are classified into three categories:

*Isotropic crystals* include materials through which monochromatic light travels with the same speed, regardless of the direction of vibration, and the vibration direction of a light ray is always perpendicular to the ray path. Whereas amorphous materials such as glasses and plastics are isotropic, only those crystals with cubic symmetry are isotropic.

---

\* This section was adapted from “Optical crystals” by B. H. T. Chai, *Handbook of Laser Science and Technology, Suppl. 2, Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 3 ff (with additions).

*Anisotropic crystals* include materials through which a light ray may travel with different speeds for different directions of vibration and in which the angle between the vibration directions and ray path may not always be  $90^\circ$ . The index of refraction of such crystals varies according to the vibration direction of the light; the optical indicatrix is no longer a sphere but an ellipsoid. Depending on the geometry of the ellipsoid, it is necessary to divide the class of the anisotropic materials further into two subgroups. Crystals with tetragonal, hexagonal, and trigonal (or rhombohedral) symmetry exhibit a unique index of refraction (symbolized as  $e$  or  $\epsilon$ ) when light vibrates parallel to the  $c$ -axis (the extraordinary ray). For light vibrating at  $90^\circ$  to the  $c$ -axis (the ordinary ray), the refractive indices are the same (symbolized as  $o$  or  $\omega$ ) in all  $360^\circ$  directions. Crystals with these types of optical properties are called *uniaxial crystals*. Crystals with orthorhombic, monoclinic, and triclinic symmetry possess three significant indices of refraction, commonly symbolized as  $x$ ,  $y$ , and  $z$  or  $\alpha$ ,  $\beta$ , and  $\gamma$  in the order from smallest to largest. The shape of the indicatrix is a three-dimensional ellipsoid with all central sections being ellipses, except for two. These two are circular sections with a radius of  $\beta$ . The normal of the two circular sections are called the optical axes. Crystals with these types of optical properties are called *biaxial crystals*. In Sections 1.2 and 1.3 crystals are grouped as isotropic, uniaxial, and biaxial.

Crystal symmetry plays a critical role in the selection of material for optical applications. Optically isotropic crystals are used most frequently for windows and lenses although a uniaxial single crystal (such as sapphire) precisely oriented along the optical axis can be used as a window material. Faraday rotator crystals for optical isolators based must be cubic or uniaxial, not biaxial. Anisotropic single crystals are widely used for other specific optical applications such as the polarizers, optical wave plates, and wedges. In nonlinear frequency conversion, all the optical materials used at present must not only be crystalline but also highly anisotropic and noncentrosymmetric.

For simplicity of crystal orientation and fabrication, materials with highest symmetry are preferred. It is easy to orient crystals with cubic (isometric), tetragonal, and hexagonal (uniaxial) symmetries. For the biaxial crystals, orthorhombic symmetry is still relatively easy to orient because all the crystallographic axes are still orthogonal and in alignment with the optical indicatrix axes. In monoclinic crystals, the crystallographic  $a$ - and  $c$ -axes are no longer orthogonal. With the exception of the  $b$ -axis, two of the optical indicatrix axes are no longer aligned with the crystallographic ones. With a few exceptions, crystals with triclinic symmetry are not listed because they are difficult to orient and have too many parameters to define (no degeneracy at all).

The preceding symmetry properties of a crystal structure refer to space group operations. For measured macroscopic properties the point group (the group of operations under which the property remains unchanged) is of interest. Eleven of the 32 point groups are centrosymmetric. Except for cubic 432, the remaining groups exhibit polarization when the crystal is subject to an applied stress (piezoelectric). Ten of these latter groups possess a unique polar axis and are pyroelectric, i.e., spontaneous polarize in the absence of stress. Crystallographic point groups and related properties are listed in the following table.

### Crystallographic Point Groups and Properties

Crystal system	International symbol	Schoenflies symbol	Centro-symmetric	Piezo-electric	Pyro-electric
Cubic	m3m	O <sub>h</sub>			
	−43m	T <sub>d</sub>			
	432	O			
	m3	T <sub>h</sub>			
	23	T			
Hexagonal	6/mmm	D <sub>6h</sub>			
	−6m2	D <sub>3h</sub>			
	6mm	C <sub>6v</sub>			
	622	D <sub>6</sub>			
	6/m	C <sub>6h</sub>			
	−6	C <sub>3h</sub>			
	6	C <sub>6</sub>			
Tetragonal	4/mmm	D <sub>4h</sub>			
	−42m	D <sub>2d</sub>			
	4mm	C <sub>4v</sub>			
	422	D <sub>4</sub>			
	4/m	C <sub>4h</sub>			
	−4	S <sub>4</sub>			
	4	C <sub>4</sub>			
Trigonal	−3m	D <sub>3d</sub>			
	3m	C <sub>3v</sub>			
	32	D <sub>3</sub>			
	−3	S <sub>6</sub>			
	3	C <sub>3</sub>			
Orthorhombic	mmm	D <sub>2h</sub>			
	mm2	C <sub>2v</sub>			
	222	D <sub>2</sub>			
Monoclinic	2/m	C <sub>2h</sub>			
	m	C <sub>s</sub>			
	2	C <sub>2</sub>			
Triclinic	−1	C <sub>i</sub>			
	1	C <sub>1</sub>			

Crystals in the following table are listed alphabetically by chemical name (with mineral name\* and acronym in parentheses) and include the chemical formula, crystal system, and space group. In the space group notation, a negative number indicates inversion symmetry.

\* A mineralogy database containing names, physical properties, and an audio pronunciation guide for a very large number of materials is available at [www.webmineral.com](http://www.webmineral.com).

### Name, Formula, Crystal System, and Space Group for Optical Crystals

Name	Formula	Crystal system (Space group)
Aluminum antimonide	AlSb	Cubic (F-43m)
Aluminum arsenate	AlAsO <sub>4</sub>	Trigonal (P3 <sub>1</sub> 2)
Aluminum arsenide	AlAs	Cubic (F-43m)
Aluminum borate	AlBO <sub>3</sub>	Trigonal (R-3c)
Aluminum borate	Al <sub>4</sub> B <sub>2</sub> O <sub>9</sub>	Orthorhombic (Pbam)
Aluminum fluoride	AlF <sub>3</sub>	Rhombohedral (R32)
Aluminum fluorosilicate (topaz)	Al <sub>2</sub> SiO <sub>4</sub> F <sub>2</sub>	Orthorhombic (Pbnm)
Aluminum gallate	AlGaO <sub>3</sub>	Hexagonal (P6 <sub>3</sub> mmc)
Aluminum germanate	Al <sub>2</sub> Ge <sub>2</sub> O <sub>7</sub>	Monoclinic (C2/c)
Aluminum germanate	Al <sub>6</sub> Ge <sub>2</sub> O <sub>13</sub>	Orthorhombic (Pbnm)
Aluminum germanate	Al <sub>6</sub> Ge <sub>2</sub> O <sub>13</sub>	Orthorhombic (Pbnm)
Aluminum hafnium tantalate	AlHfTaO <sub>6</sub>	Orthorhombic (Pbcn)
Aluminum molybdate	Al <sub>2</sub> (MoO <sub>4</sub> ) <sub>3</sub>	Monoclinic (P2 <sub>1</sub> /a)
Aluminum niobate	AlNbO <sub>4</sub>	Monoclinic (C2/m)
Aluminum nitride	AlN	Hexagonal (6 <sub>3</sub> mc)
Aluminum oxide (corundum, sapphire, alumina)	Al <sub>2</sub> O <sub>3</sub>	Trigonal (R-3c)
Aluminum oxynitrate (ALON)	Al <sub>23</sub> O <sub>27</sub> N <sub>5</sub>	Cubic (Fd3m)
Aluminum phosphate (berlinite)	AlPO <sub>4</sub>	Trigonal (P3 <sub>1</sub> 2)
Aluminum phosphide	AlP	Hexagonal (6 <sub>3</sub> mc)
Aluminum silicate (andalusite)	Al <sub>2</sub> SiO <sub>5</sub>	Orthorhombic (Pnam)
Aluminum silicate (kyanite)	Al <sub>2</sub> SiO <sub>5</sub>	Triclinic (P-1)
Aluminum silicate (mullite)	Al <sub>6</sub> Si <sub>2</sub> O <sub>13</sub>	Orthorhombic (Pbnm)
Aluminum silicate (sillimanite)	Al <sub>2</sub> SiO <sub>5</sub>	Orthorhombic (Pbnm)
Aluminum tantalate (alumotantite)	AlTaO <sub>4</sub>	Orthorhombic (Pc2 <sub>1</sub> n)
Aluminum titanium tantalate	AlTiTaO <sub>6</sub>	Tetragonal (P4 <sub>2</sub> /mmm)
Aluminum tungstate	Al <sub>2</sub> (WO <sub>4</sub> ) <sub>3</sub>	Orthorhombic (Pcna)
Amino carbonyl (urea)	(NH <sub>2</sub> ) <sub>2</sub> CO	Tetragonal (I-42m)
Ammonium aluminum selenate	NH <sub>4</sub> Al(SeO <sub>4</sub> ) <sub>2</sub>	Trigonal (P321)
Ammonium aluminum sulfate	NH <sub>4</sub> Al(SO <sub>4</sub> ) <sub>2</sub>	Trigonal (P321)
Ammonium dihydrogen phosphate (ADP)	NH <sub>4</sub> H <sub>2</sub> PO <sub>4</sub>	Tetragonal (I-42m)
Ammonium gallium selenate	NH <sub>4</sub> Ga(SeO <sub>4</sub> ) <sub>2</sub>	Trigonal (P321)
Ammonium gallium sulfate	NH <sub>4</sub> Ga(SO <sub>4</sub> ) <sub>2</sub>	Trigonal (P321)
Ammonium pentaborate	NH <sub>4</sub> B <sub>5</sub> O <sub>8</sub> •4H <sub>2</sub> O	Orthorhombic (Aba2)
Antimony niobate (stibiocolumbite)	SbNbO <sub>4</sub>	Orthorhombic (Pna2 <sub>1</sub> )
Antimony oxide (senarmontite)	Sb <sub>2</sub> O <sub>3</sub>	Cubic (Fd3m)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Antimony oxide (valentinite)	Sb <sub>2</sub> O <sub>3</sub>	Orthorhombic (Pccn)
Antimony tantalate (stibiotantalite)	SbTaO <sub>4</sub>	Orthorhombic (Pc2 <sub>1</sub> n)
Arsenic antimony sulfide (getchellite)	AsSbS <sub>3</sub>	Monoclinic (P2 <sub>1</sub> /a)
Arsenic oxide (arsenolite)	As <sub>2</sub> O <sub>3</sub>	Cubic (Fd3m)
Arsenic sulfide (orpiment)	As <sub>2</sub> S <sub>3</sub>	Monoclinic (P2 <sub>1</sub> n)
Arsenic sulfide (realgar)	AsS	Monoclinic (P2 <sub>1</sub> n)
Barium aluminate	BaAl <sub>2</sub> O <sub>4</sub>	Hexagonal (P6 <sub>3</sub> 22)
Barium aluminate	Ba <sub>3</sub> Al <sub>2</sub> O <sub>6</sub>	Cubic (Pa3)
Barium aluminum borate	BaAl <sub>2</sub> B <sub>2</sub> O <sub>7</sub>	Monoclinic (P2/c)
Barium aluminum fluoride	Ba <sub>3</sub> Al <sub>2</sub> F <sub>12</sub>	Orthorhombic (Pnnm)
Barium aluminum germanate	BaAl <sub>2</sub> Ge <sub>2</sub> O <sub>8</sub>	Monoclinic (P2 <sub>1</sub> /a)
Barium aluminum silicate (celsian)	BaAl <sub>2</sub> Si <sub>2</sub> O <sub>8</sub>	Monoclinic (I2/a)
Barium antimonate	BaSb <sub>2</sub> O <sub>6</sub>	Triclinic (P–3 1m)
Barium beryllium fluorophosphate (babefphite)	BaBe(PO <sub>4</sub> )F	Hexagonal(P–6c2)
Barium beryllium silicate (barylite)	BaBe <sub>2</sub> Si <sub>2</sub> O <sub>7</sub>	Orthorhombic (Pnma)
Barium tetraborate	BaB <sub>4</sub> O <sub>7</sub>	Monoclinic (P2 <sub>1</sub> /c)
Barium borate	β-BaB <sub>2</sub> O <sub>4</sub>	Trigonal (R3c)
Barium cadmium aluminum fluoride	BaCdAlF <sub>7</sub>	Monoclinic (C2/c)
Barium cadmium gallium fluoride	BaCdGaF <sub>7</sub>	Monoclinic (C2/c)
Barium cadmium magnesium aluminum fluoride	Ba <sub>2</sub> CdMgAl <sub>2</sub> F <sub>14</sub>	Monoclinic (C2/c)
Barium calcium magnesium aluminum fluoride	Ba <sub>2</sub> CaMgAl <sub>2</sub> F <sub>14</sub>	Monoclinic (C2/c)
Barium calcium magnesium silicate	BaCa <sub>2</sub> Mg(SiO <sub>4</sub> ) <sub>2</sub>	Orthorhombic
Barium calcium silicate (walstromite)	BaCa <sub>2</sub> Si <sub>3</sub> O <sub>9</sub>	Triclinic(P–1)
Barium carbonate (witherite)	BaCO <sub>3</sub>	Orthorhombic (Pnam)
Barium chloroarsenate (movelandite)	Ba <sub>5</sub> (AsO <sub>4</sub> ) <sub>3</sub> Cl	Hexagonal(P6 <sub>3</sub> /m)
Barium chloroborate	Ba <sub>2</sub> B <sub>5</sub> O <sub>9</sub> Cl	Tetragonal (P4 <sub>2</sub> 2 <sub>1</sub> –2)
Barium chlorophosphate (alforsite)	Ba <sub>5</sub> (PO <sub>4</sub> ) <sub>3</sub> Cl	Hexagonal(P6 <sub>3</sub> /m)
Barium chlorovanadate	Ba <sub>5</sub> (VO <sub>4</sub> ) <sub>3</sub> Cl	Hexagonal(P6 <sub>3</sub> /m)
Barium fluoride-calcium fluoride (T-12)	BaF <sub>2</sub> –CaF <sub>2</sub>	Cubic (Fm3m)
Barium fluoride (frankdicksonite)	BaF <sub>2</sub>	Cubic (Fm3m)
Barium fluoroarsenate	Ba <sub>5</sub> (AsO <sub>4</sub> ) <sub>3</sub> F	Hexagonal(P6 <sub>3</sub> /m)
Barium fluorophosphate	Ba <sub>5</sub> (PO <sub>4</sub> ) <sub>3</sub> F	Hexagonal(P6 <sub>3</sub> /m)
Barium fluorovanadate	Ba <sub>5</sub> (VO <sub>4</sub> ) <sub>3</sub> F	Hexagonal(P6 <sub>3</sub> /m)
Barium gallium fluoride	BaGaF <sub>5</sub>	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Barium germanate	BaGeO <sub>3</sub>	Orthorhombic
Barium germanate	BaGe <sub>2</sub> O <sub>5</sub>	Monoclinic (P2 <sub>1</sub> /a)
Barium germanate	BaGe <sub>4</sub> O <sub>9</sub>	Hexagonal(P–6c2)
Barium germanium aluminate	BaGeAl <sub>6</sub> O <sub>12</sub>	Orthorhombic (Pnnm)
Barium germanium gallate	BaGeGa <sub>6</sub> O <sub>12</sub>	Orthorhombic (Pnnm)
Barium hexa-aluminate	BaAl <sub>12</sub> O <sub>19</sub>	Hexagonal (P6 <sub>3</sub> /mmc)
Barium lithium niobate	Ba <sub>2</sub> LiNb <sub>5</sub> O <sub>15</sub>	Orthorhombic (Im2a)
Barium lutetium borate	Ba <sub>3</sub> Lu(BO <sub>3</sub> ) <sub>3</sub>	Hexagonal(P6 <sub>3</sub> cm)
Barium magnesium aluminum fluoride	Ba <sub>2</sub> MgAlF <sub>9</sub>	Tetragonal (P4)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Barium magnesium fluoride	BaMgF <sub>4</sub>	Orthorhombic (A2 <sub>1</sub> am)
Barium magnesium fluoride	Ba <sub>2</sub> MgF <sub>6</sub>	Tetragonal (I422)
Barium magnesium germanate	Ba <sub>2</sub> MgGe <sub>2</sub> O <sub>7</sub>	Tetragonal (P42 <sub>1</sub> m)
Barium magnesium silicate	Ba <sub>2</sub> MgSi <sub>2</sub> O <sub>7</sub>	Tetragonal (P42 <sub>1</sub> m)
Barium magnesium tantalate	Ba <sub>3</sub> MgTa <sub>2</sub> O <sub>9</sub>	Cubic (Fm3m)
Barium magnesium vanadate	BaMg <sub>2</sub> (VO <sub>4</sub> ) <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /acd)
Barium molybdate	BaMoO <sub>4</sub>	Tetragonal (I4 <sub>1</sub> /a)
Barium niobate	BaNb <sub>2</sub> O <sub>6</sub>	Orthorhombic (Pcan)
Barium nitrate (nitrobarite)	Ba(NO <sub>3</sub> ) <sub>2</sub>	Cubic (P2 <sub>1</sub> 3)
Barium scandate	Ba <sub>2</sub> Sc <sub>4</sub> O <sub>9</sub>	Trigonal(R-3)
Barium scandate	BaSc <sub>2</sub> O <sub>4</sub>	Monoclinic (C2/c)
Barium scandate	Ba <sub>6</sub> Sc <sub>6</sub> O <sub>15</sub>	Tetragonal
Barium silicate (sabbornite)	β-BaSi <sub>2</sub> O <sub>5</sub>	Orthorhombic (Pmnb)
Barium sodium niobate	Ba <sub>2</sub> NaNb <sub>5</sub> O <sub>15</sub>	Orthorhombic (Im2a)
Barium sodium phosphate	Ba <sub>2</sub> Na(PO <sub>5</sub> ) <sub>5</sub>	Orthorhombic (P212121))
Barium strontium niobate	Ba <sub>3</sub> SrNb <sub>2</sub> O <sub>9</sub>	Hexagonal (P63/mmc)
Barium strontium tantalate	Ba <sub>3</sub> SrTa <sub>2</sub> O <sub>9</sub>	Hexagonal (P63/mmc)
Barium sulfate (barite)	BaSO <sub>4</sub>	Orthorhombic (Pbnm)
Barium tantalate	BaTa <sub>2</sub> O <sub>6</sub>	Orthorhombic (Pcan)
Barium tantalate	BaTa <sub>2</sub> O <sub>6</sub>	Orthorhombic (Pcan)
Barium tin borate	BaSnB <sub>2</sub> O <sub>6</sub>	Trigonal(R-3)
Barium tin silicate (pabstite)	BaSnSi <sub>3</sub> O <sub>9</sub>	Hexagonal (P-6c2)
Barium titanate	BaTiO <sub>3</sub>	Cubic (Fm3m)
Barium titanate	BaTiO <sub>3</sub>	Tetragonal (Pm3m)
Barium titanium aluminate	BaTiAl <sub>6</sub> O <sub>12</sub>	Orthorhombic (Pnnm)
Barium titanium aluminate	Ba <sub>3</sub> TiAl <sub>10</sub> O <sub>20</sub>	Monoclinic (C2/m)
Barium titanium borate	BaTiB <sub>2</sub> O <sub>6</sub>	Trigonal(R-3)
Barium titanium gallate	BaTiGa <sub>6</sub> O <sub>12</sub>	Orthorhombic (Pnnm)
Barium titanium oxide	BaTi <sub>4</sub> O <sub>9</sub>	Orthorhombic (Pnmm)
Barium titanium silicate (benitoite)	BaTiSi <sub>3</sub> O <sub>9</sub>	Hexagonal (P-6c2)
Barium titanium silicate (fresnoite)	Ba <sub>2</sub> TiSi <sub>2</sub> O <sub>8</sub>	Tetragonal (P4bm)
Barium tungstate	BaWO <sub>4</sub>	Tetragonal (I4 <sub>1</sub> /a)
Barium vanadate	Ba <sub>3</sub> (VO <sub>4</sub> ) <sub>2</sub>	Rhombohedral (R-3m)
Barium yttrium borate	Ba <sub>3</sub> Lu(BO <sub>3</sub> ) <sub>3</sub>	Hexagonal(P6 <sub>3</sub> cm)
Barium yttrium fluoride	BaY <sub>2</sub> F <sub>8</sub>	Monoclinic (C2/m)
Barium yttrium oxide	BaY <sub>2</sub> O <sub>4</sub>	Orthorhombic (Pnab)
Barium zinc aluminum fluoride	Ba <sub>2</sub> ZnAlF <sub>9</sub>	Orthorhombic (Pnma)
Barium zinc fluoride	BaZnF <sub>4</sub>	Othorhombic (C222)
Barium zinc fluoride	Ba <sub>2</sub> Zn <sub>3</sub> F <sub>10</sub>	Monoclinic (C2/m)
Barium zinc fluoride	Ba <sub>2</sub> ZnF <sub>6</sub>	Tetragonal (I422)
Barium zinc gallium fluoride	Ba <sub>2</sub> ZnGaF <sub>9</sub>	Monoclinic (P2 <sub>1</sub> /n)
Barium zinc germanate	BaZnGeO <sub>4</sub>	Hexagonal (P6 <sub>3</sub> )
Barium zinc germanate	Ba <sub>2</sub> ZnGe <sub>2</sub> O <sub>7</sub>	Tetragonal (P42 <sub>1</sub> m)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Barium zinc silicate	Ba <sub>2</sub> ZnSi <sub>2</sub> O <sub>7</sub>	Tetragonal (P4 <sub>2</sub> 1m)
Barium zinc silicate	BaZnSiO <sub>4</sub>	Hexagonal (P6 <sub>3</sub> )
Barium zirconium silicate	Ba <sub>2</sub> ZrSi <sub>2</sub> O <sub>8</sub>	Tetragonal (P4bm)
Barium zirconium silicate	Ba <sub>2</sub> Zr <sub>2</sub> Si <sub>3</sub> O <sub>12</sub>	Cubic (P2 <sub>1</sub> 3)
Barium zirconium silicate (bazirite)	BaZrSi <sub>3</sub> O <sub>9</sub>	Hexagonal (P6 <sub>3</sub> 22)
Beryllium aluminate	BeAl <sub>6</sub> O <sub>10</sub>	Orthorhombic (Pca2)
Beryllium aluminate (chrysoberyl)	BeAl <sub>2</sub> O <sub>4</sub>	Orthorhombic (Pnma)
Beryllium aluminum silicate (beryl)	Be <sub>3</sub> Al <sub>2</sub> Si <sub>6</sub> O <sub>18</sub>	Hexagonal (P6/mcc)
Beryllium fluoroborate (hambergite)	Be <sub>2</sub> BO <sub>3</sub> F	Monoclinic (C21)
Beryllium germanate	Be <sub>2</sub> GeO <sub>4</sub>	Trigonal(R-3)
Beryllium magnesium aluminate (taaffeite)	BeMg <sub>3</sub> Al <sub>8</sub> O <sub>16</sub>	Hexagonal
Beryllium oxide (bormellite)	BeO	Hexagonal (P6 <sub>3</sub> /mc)
Beryllium scandium silicate (bazzite)	Be <sub>3</sub> Sc <sub>2</sub> Si <sub>6</sub> O <sub>18</sub>	Hexagonal (P6/mcc)
Beryllium silicate (phenakite)	Be <sub>2</sub> SiO <sub>4</sub>	Trigonal(R-3)
Bismuth aluminate	Bi <sub>2</sub> Al <sub>4</sub> O <sub>9</sub>	Orthorhombic (Pbam)
Bismuth antimonate	BiSbO <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /c)
Bismuth borate	Bi <sub>4</sub> B <sub>2</sub> O <sub>9</sub>	Monoclinic (P2 <sub>1</sub> /c)
Bismuth germanate	Bi <sub>2</sub> Ge <sub>3</sub> O <sub>9</sub>	Hexagonal (P6 <sub>3</sub> /m)
Bismuth germanate	Bi <sub>2</sub> GeO <sub>5</sub>	Orthorhombic (Cmc2 <sub>1</sub> )
Bismuth germanate	Bi <sub>12</sub> GeO <sub>20</sub>	Cubic (I23)
Bismuth germanate (BGO)	Bi <sub>4</sub> Ge <sub>3</sub> O <sub>12</sub>	Cubic (I43d)
Bismuth metaborate	BiB <sub>3</sub> O <sub>6</sub>	Monoclinic (2/m)
Bismuth molybdate	Bi <sub>2</sub> Mo <sub>2</sub> O <sub>9</sub>	Monoclinic (P2 <sub>1</sub> /m)
Bismuth molybdate	Bi <sub>2</sub> Mo <sub>3</sub> O <sub>12</sub>	Monoclinic (P2 <sub>1</sub> /m)
Bismuth niobate	BiNbO <sub>4</sub>	Orthorhombic (Pann)
Bismuth oxide (bismite)	Bi <sub>2</sub> O <sub>3</sub>	Monoclinic (P2 <sub>1</sub> /c)
Bismuth oxymolybdate (koechlinite)	γ-Bi <sub>2</sub> MoO <sub>6</sub>	Orthorhombic (Pba2)
Bismuth oxytungstate (rusellite)	Bi <sub>2</sub> WO <sub>6</sub>	Orthorhombic (Pba2)
Bismuth silicate	Bi <sub>2</sub> SiO <sub>5</sub>	Orthorhombic (Cmc2 <sub>1</sub> )
Bismuth silicate (eulytite)	Bi <sub>4</sub> Si <sub>3</sub> O <sub>12</sub>	Cubic (I43d)
Bismuth silicate (sillenite, BSO)	Bi <sub>12</sub> SiO <sub>20</sub>	Cubic (I23)
Bismuth tantalate	BiTaO <sub>4</sub>	Orthorhombic (Pnna)
Bismuth tin oxide	Bi <sub>2</sub> Sn <sub>2</sub> O <sub>7</sub>	Hexagonal (P6 <sub>3</sub> /m)
Bismuth titanate	Bi <sub>4</sub> Ti <sub>3</sub> O <sub>12</sub>	Orthorhombic (B2cb)
Bismuth titanium niobate	Bi <sub>3</sub> TiNbO <sub>9</sub>	Orthorhombic (A2 <sub>1</sub> am)
Bismuth titanium oxide	Bi <sub>12</sub> TiO <sub>20</sub>	Cubic (I23)
Bismuth vanadate (clinobisvanite)	BiVO <sub>4</sub>	Monoclinic (I2/a)
Bismuth vanadate (dreyerite)	BiVO <sub>4</sub>	Tetragonal (I4 <sub>1</sub> /amd)
Bismuth vanadate (pucherite)	BiVO <sub>4</sub>	Orthorhombic (Pnca)
Boron nitride	BN	Cubic (F-43m)
Boron phosphide	BP	Cubic (F-43m)
Cadmium antimonate	Cd <sub>2</sub> Sb <sub>2</sub> O <sub>7</sub>	Cubic (Fd3m)
Cadmium borate	CdB <sub>4</sub> O <sub>7</sub>	Orthorhombic (Pbca)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Cadmium borate	$\text{Cd}_2\text{B}_2\text{O}_5$	Triclinic (P1)
Cadmium borate	$\text{Cd}_2\text{B}_6\text{O}_{11}$	Monoclinic (P2 <sub>1</sub> /b)
Cadmium borate	$\text{CdB}_2\text{O}_4$	Cubic (P–43m)
Cadmium carbonate (otavite)	$\text{CdCO}_3$	Rhombohedral (R–3c)
Cadmium chloride	$\text{CdCl}_2$	Rhombohedral (R–3m)
Cadmium chloroarsenate	$\text{Cd}_5(\text{AsO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Cadmium chlorophosphate	$\text{Cd}_5(\text{PO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Cadmium chlorovanadate	$\text{Cd}_5(\text{VO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Cadmium fluoride	$\text{CdF}_2$	Cubic (Fm3m)
Cadmium fluorophosphate	$\text{Cd}_5(\text{PO}_4)_3\text{F}$	Hexagonal (P6 <sub>3</sub> /m)
Cadmium gallate	$\text{CdGa}_2\text{O}_4$	Cubic (Fd3m)
Cadmium germanate	$\text{Cd}_2\text{GeO}_4$	Orthorhombic (Pbnm)
Cadmium germanium arsenide	$\text{CdGeAs}_2$	Tetragonal (I–42d)
Cadmium germanium phosphide	$\text{CdGeP}_2$	Tetragonal (I–42d)
Cadmium indium oxide spinel	$\text{CdIn}_2\text{O}_4$	Cubic (Fd3m)
Cadmium iodide	$\text{CdI}_2$	Hexagonal (P6 <sub>3</sub> mc)
Cadmium niobate	$\text{Cd}_2\text{Nb}_2\text{O}_7$	Cubic (Fd3m)
Cadmium oxide (monteponite)	$\text{CdO}$	Cubic (Fm3m)
Cadmium scandium germanate	$\text{Cd}_3\text{Sc}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Cadmium selenide (cadmoselite)	$\text{CdSe}$	Hexagonal (P6mm)
Cadmium silicon arsenide	$\text{CdSiAs}_2$	Tetragonal (I–42d)
Cadmium silicon phosphide	$\text{CdSiP}_2$	Tetragonal (I–42d)
Cadmium sulfide (greenockite)	$\text{CdS}$	Hexagonal (6mm)
Cadmium tellurite (Irtan 6)	$\text{CdTe}$	Cubic (Fm3m)
Cadmium tin arsenide	$\text{CdSnAs}_2$	Tetragonal (I–42d)
Cadmium tin borate	$\text{CdSnB}_2\text{O}_6$	Rhombohedral (R–3c)
Cadmium tin phosphide	$\text{CdSnP}_2$	Tetragonal (I–42d)
Cadmium titanate	$\text{CdTiO}_3$	Rhombohedral (R–3)
Cadmium tungstate	$\text{CdWO}_4$	Monoclinic (P2/c)
Cadmium vanadate	$\text{CdV}_2\text{O}_6$	Monoclinic (C2/m)
Cadmium vanadate	$\text{Cd}_2\text{V}_2\text{O}_7$	Monoclinic (C2/m)
Calcium aluminate	$\text{CaAl}_2\text{O}_4$	Monoclinic (P2 <sub>1</sub> /n)
Calcium aluminate	$\text{Ca}_3\text{Al}_2\text{O}_6$	Cubic (Pa–3)
Calcium aluminate	$\text{CaAl}_4\text{O}_7$	Monoclinic (C2/c)
Calcium aluminate	$\text{Ca}_5\text{Al}_6\text{O}_{14}$	Orthorhombic (C222)
Calcium aluminate (brownmillerite)	$\text{Ca}_2\text{Al}_2\text{O}_5$	Orthorhombic
Calcium aluminate (mayenite)	$\text{Ca}_{12}\text{Al}_{14}\text{O}_{33}$	Cubic (I43d)
Calcium aluminum borate	$\text{CaAlBO}_4$	Orthorhombic (Pnam)
Calcium aluminum borate	$\text{CaAl}_2\text{B}_2\text{O}_7$	Hexagonal (P6 <sub>3</sub> 22)
Calcium aluminum borate (johachidolite)	$\text{CaAlB}_3\text{O}_7$	Orthorhombic (Cmma)
Calcium aluminum fluoride	$\text{CaAlF}_5$	Monoclinic (C2/c)
Calcium aluminum fluoride	$\text{Ca}_2\text{AlF}_7$	Orthorhombic (Pnma)
Calcium aluminum fluoride (prosopite)	$\text{CaAl}_2\text{F}_8$	Monoclinic

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Calcium aluminum germanate	$\text{Ca}_2\text{Al}_2\text{GeO}_7$	Tetragonal (P42 <sub>1</sub> m)
Calcium aluminum germanate	$\text{Ca}_3\text{Al}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium aluminum oxyfluoride	$\text{Ca}_2\text{Al}_3\text{O}_6\text{F}$	Hexagonal
Calcium aluminum silicate (anorthite)	$\text{CaAl}_2\text{Si}_2\text{O}_8$	Triclinic(P–1)
Calcium aluminum silicate (gehlenite, CAS)	$\text{Ca}_2\text{Al}_2\text{SiO}_7$	Tetragonal (P42 <sub>1</sub> m)
Calcium aluminum silicate (grossularite)	$\text{Ca}_3\text{Al}_2\text{Si}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium antimonate	$\text{Ca}_2\text{Sb}_2\text{O}_7$	Orthorhombic (Imm2)
Calcium antimonate	$\text{Ca}_2\text{Sb}_2\text{O}_7$	Cubic (Fd3m)
Calcium barium carbonate (alstonite)	$\text{CaBa}(\text{CO}_3)_2$	Orthorhombic (Pnam)
Calcium beryllium fluorophosphate (herderite)	$\text{CaBe}(\text{PO}_4)\text{F}$	Monoclinic
Calcium beryllium phosphate (hurlbutite)	$\text{CaBe}_2(\text{PO}_4)_2$	Monoclinic (P2 <sub>1</sub> /a)
Calcium beryllium silicate (gugiaite)	$\text{Ca}_2\text{BeSi}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Calcium borate	$\text{Ca}_2\text{B}_2\text{O}_5$	Monoclinic (P2 <sub>1</sub> /a)
Calcium borate	$\text{Ca}_2\text{B}_6\text{O}_{11}$	Monoclinic (P2 <sub>1</sub> /b)
Calcium borate	$\text{CaB}_4\text{O}_7$	Monoclinic (P2 <sub>1</sub> /c)
Calcium borate	$\text{Ca}_3\text{B}_2\text{O}_6$	Rhombohedral (R–3c)
Calcium borate (calciborite)	$\text{CaB}_2\text{O}_4$	Orthorhombic (Pnca)
Calcium boron silicate (danburite)	$\text{CaB}_2\text{Si}_2\text{O}_8$	Orthorhombic (Pmam)
Calcium carbonate (aragonite)	$\text{CaCO}_3$	Orthorhombic (Pnam)
Calcium carbonate (calcite)	$\text{CaCO}_3$	Rhombohedral (R–3c)
Calcium carbonate (vaterite)	$\text{CaCO}_3$	Hexagonal (P6 <sub>3</sub> /mmc)
Calcium chloroarsenate	$\text{Ca}_2\text{AsO}_4\text{Cl}$	Orthorhombic (Pbcm)
Calcium chloroarsenate	$\text{Ca}_5(\text{AsO}_4)_3\text{Cl}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium chloroborate	$\text{Ca}_2\text{BO}_3\text{Cl}$	Monoclinic (P2 <sub>1</sub> /c)
Calcium chloroborate	$\text{Ca}_2\text{B}_5\text{O}_9\text{Cl}$	Tetragonal (P42 <sub>2</sub> 12)
Calcium chlorophosphate	$\text{Ca}_2\text{PO}_4\text{Cl}$	Orthorhombic (Pbcm)
Calcium chlorophosphate (chlorapatite)	$\text{Ca}_5(\text{PO}_4)_3\text{Cl}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium chlorovanadate	$\text{Ca}_2\text{VO}_4\text{Cl}$	Orthorhombic (Pbcm)
Calcium chlorovanadate	$\text{Ca}_5(\text{VO}_4)_3\text{Cl}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium fluoride (fluorite, fluorspar, Irtan 3)	$\text{CaF}_2$	Cubic (Fm3m)
Calcium fluoroarsenate (svabite, CAAP)	$\text{Ca}_5(\text{AsO}_4)_3\text{F}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium fluoroborate (fabianite)	$\text{CaB}_3\text{O}_5\text{F}$	Orthorhombic (Pbn2 <sub>1</sub> )
Calcium fluorophosphate (apatite, FAP)	$\text{Ca}_5(\text{PO}_4)_3\text{F}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium fluorophosphate (spodiosite)	$\text{Ca}_2(\text{PO}_4)\text{F}$	Orthorhombic (Pbcm)
Calcium fluorovanadate (VAP)	$\text{Ca}_5(\text{VO}_4)_3\text{F}$	Hexagonal(P6 <sub>3</sub> /m)
Calcium gadolinium aluminate	$\text{CaGaAlO}_4$	Hexagonal (P6 <sub>3</sub> /m)
Calcium gadolinium double borate	$\text{Ca}_3\text{Gd}_2(\text{BO}_3)_4$	Orthorhombic (Pc2 <sub>1</sub> n)
Calcium gadolinium oxysilicate	$\text{CaGd}_4(\text{SiO}_4)_3\text{O}$	Tetragonal (I4/mmm)
Calcium gadolinium phosphate	$\text{Ca}_3\text{Gd}(\text{PO}_4)_3$	Cubic (I–43d)
Calcium gallate	$\text{CaGa}_2\text{O}_4$	Monoclinic (P2 <sub>1</sub> /c)
Calcium gallate	$\text{Ca}_3\text{Ga}_4\text{O}_9$	Orthorhombic (Cmm2)
Calcium gallate	$\text{Ca}_5\text{Ga}_6\text{O}_{14}$	Orthorhombic (Cmc2 <sub>1</sub> )
Calcium gallium germanate	$\text{Ca}_2\text{Ga}_2\text{GeO}_7$	Tetragonal (P42 <sub>1</sub> m)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Calcium gallium germanate	$\text{Ca}_3\text{Ga}_2\text{Ge}_4\text{O}_{14}$	Trigonal (P32 <sub>1</sub> )
Calcium gallium germanium garnet	$\text{Ca}_3\text{Ga}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium gallium silicate (CGS)	$\text{Ca}_2\text{Ga}_2\text{SiO}_7$	Tetragonal (P42 <sub>1</sub> m)
Calcium germanate	$\text{CaGe}_2\text{O}_5$	Monoclinic (P2 <sub>1</sub> /a)
Calcium germanate	$\text{CaGe}_4\text{O}_9$	Hexagonal (P–6c2)
Calcium hexa-aluminate	$\text{CaAl}_{12}\text{O}_{19}$	Hexagonal (P63/mmc)
Calcium indate	$\text{CaIn}_2\text{O}_4$	Orthorhombic (Pbcm)
Calcium indium germanate	$\text{Ca}_3\text{In}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium indium oxide	$\text{Ca}_3\text{In}_2\text{O}_6$	Orthorhombic (Pbam)
Calcium iodate (lautarite)	$\text{Ca}(\text{IO}_3)_2$	Monoclinic
Calcium lanthanum aluminate	$\text{CaLaAlO}_4$	Tetragonal (I4/mmm)
Calcium lanthanum borate	$\text{CaLaBO}_4$	Hexagonal (P6 <sub>3</sub> 22)
Calcium lanthanum oxyphosphate	$\text{Ca}_4\text{La}(\text{PO}_4)_3\text{O}$	Hexagonal (P6 <sub>3</sub> /m)
Calcium lanthanum oxysilicate	$\text{CaLa}_4(\text{SiO}_4)_3\text{O}$	Hexagonal (P6 <sub>3</sub> /m)
Calcium lanthanum phosphate	$\text{Ca}_3\text{La}(\text{PO}_4)_3$	Cubic (I–43d)
Calcium lanthanum sulfide	$\text{CaLa}_2\text{S}_4$	Cubic (I–43d)
Calcium lithium magnesium vanadate	$\text{Ca}_2\text{LiMg}_2\text{V}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium lithium magnesium vanadate	$\text{Ca}_3\text{LiMgV}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium lithium zinc vanadate	$\text{Ca}_2\text{LiZn}_2\text{V}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium lithium zinc vanadate	$\text{Ca}_3\text{LiZnV}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium lutetium germanate	$\text{Ca}_3\text{Lu}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium magnesium borate (kurchatovite)	$\text{CaMgB}_2\text{O}_5$	Orthorhombic
Calcium magnesium carbonate (dolomite)	$\text{CaMg}(\text{CO}_3)_2$	Rhombohedral (R–3c)
Calcium magnesium carbonate (huntite)	$\text{CaMg}_3(\text{CO}_3)_4$	Rhombohedral (R32)
Calcium magnesium fluoroarsenate (tilasite)	$\text{CaMgAsO}_4\text{F}$	Orthorhombic
Calcium magnesium fluorophosphate (isokite)	$\text{CaMgPO}_4\text{F}$	Monoclinic (C2/c)
Calcium magnesium germanate	$\text{CaMgGe}_2\text{O}_6$	Monoclinic (C2/c)
Calcium magnesium silicate (akermanite)	$\text{Ca}_2\text{MgSi}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Calcium magnesium silicate (diopside)	$\text{CaMgSi}_2\text{O}_6$	Monoclinic (C2/c)
Calcium magnesium silicate (merwinite)	$\text{Ca}_3\text{MgSi}_2\text{O}_8$	Monoclinic (P2 <sub>1</sub> /a)
Calcium magnesium silicate (monticellite)	$\text{CaMgSiO}_4$	Orthorhombic (Pmnb)
Calcium magnesium vanadate	$\text{CaMg}_2(\text{VO}_4)_2$	Tetragonal (I4 <sub>1</sub> /acd)
Calcium molybdate	$\text{CaMoO}_4$	Tetragonal (I4 <sub>1</sub> /a)
Calcium niobate	$\text{Ca}_2\text{Nb}_2\text{O}_7$	Orthorhombic (Pn2 <sub>1</sub> a)
Calcium niobate (rynersonite)	$\text{CaNb}_2\text{O}_6$	Orthorhombic (Pcan)
Calcium niobium gallium garnet	$\text{Ca}_3(\text{Nb,Ga})_2\text{Ga}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium oxide (lime)	$\text{CaO}$	Cubic (Fm3m)
Calcium phosphate	$\beta\text{-CaP}_2\text{O}_7$	Hexagonal (P–6c2)
Calcium phosphate	$\beta\text{-CaP}_2\text{O}_7$	Tetragonal (P4 <sub>1</sub> )
Calcium scandate	$\text{CaSc}_2\text{O}_4$	Orthorhombic (Pnam)
Calcium scandium germanate	$\text{Ca}_3\text{Sc}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium scandium silicate	$\text{Ca}_3\text{Sc}_2\text{Si}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium silicate (larnite)	$\text{b-Ca}_2\text{SiO}_4$	Monoclinic (P2 <sub>1</sub> /n)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Calcium silicate (rankinite)	$\text{Ca}_3\text{Si}_2\text{O}_7$	Monoclinic
Calcium silicate (wollastonite)	$\text{CaSiO}_3$	Triclinic(P-1)
Calcium sodium magnesium vanadate	$\text{Ca}_2\text{NaMg}_2\text{V}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium sodium zinc vanadate	$\text{Ca}_2\text{NaZn}_2\text{V}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium sulfate (anhydrite)	$\text{CaSO}_4$	Orthorhombic (Bbmm)
Calcium tantalate	$\text{CaTa}_2\text{O}_6$	Orthorhombic (Pcan)
Calcium tellurate (denningite)	$\text{Ca}_2\text{Te}_2\text{O}_5$	Tetragonal
Calcium tin borate (nordenskiöldine)	$\text{CaSnB}_2\text{O}_6$	Trigonal (R-3m)
Calcium tin oxide	$\text{CaSnO}_3$	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Calcium tin silicate (malayaite)	$\text{CaSnSiO}_5$	Monoclinic (P2 <sub>1</sub> /a)
Calcium titanate (perovskite)	$\text{CaTiO}_3$	Cubic (Pm3m)
Calcium titanium germanate	$\text{CaTiGeO}_4$	Monoclinic (P2 <sub>1</sub> /a)
Calcium titanium silicate (sphene)	$\text{CaTiSiO}_5$	Monoclinic (P2 <sub>1</sub> /a)
Calcium tungstate (scheelite)	$\text{CaWO}_4$	Tetragonal (I4 <sub>1</sub> /a)
Calcium vanadate	$\text{CaV}_2\text{O}_6$	Monoclinic (C2/m)
Calcium vanadate	$\text{Ca}_2\text{V}_2\text{O}_7$	Monoclinic (C2/m)
Calcium vanadate	$\text{Ca}_3(\text{VO}_4)_2$	Trigonal (R3c)
Calcium yttrium aluminate	$\text{CaYAlO}_4$	Tetragonal (I4/mmm)
Calcium yttrium borate	$\text{CaYBO}_4$	Orthorhombic (Pnam)
Calcium gadolinium double borate	$\text{Ca}_3\text{Y}_2(\text{BO}_3)_4$	Orthorhombic (Pc2 <sub>1</sub> n)
Calcium yttrium magnesium germanium garnet	$\text{CaY}_2\text{Mg}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Calcium yttrium oxysilicate	$\text{Ca}_4\text{Y}_6(\text{SiO}_4)_6$	Hexagonal (P6 <sub>3</sub> /m)
Calcium yttrium oxysilicate (SOAP)	$\text{CaY}_4(\text{SiO}_4)_3\text{O}$	Hexagonal (P6 <sub>3</sub> /m)
Calcium zinc fluoride	$\text{CaZnF}_4$	Tetragonal (I4 <sub>1</sub> /a)
Calcium zinc germanate	$\text{CaZnGe}_2\text{O}_6$	Monoclinic (C2/c)
Calcium zinc silicate (esperite)	$\text{CaZnSiO}_4$	Tetragonal (P-42 <sub>1</sub> m)
Calcium zinc silicate (hardystonite)	$\text{Ca}_2\text{ZnSi}_2\text{O}_7$	Tetragonal (P-42 <sub>1</sub> m)
Calcium zirconium boron aluminate (painite)	$\text{CaZrBAL}_9\text{O}_{18}$	Hexagonal (P6 <sub>3</sub> )
Calcium zirconium silicate (gittinsite)	$\text{CaZrSi}_2\text{O}_7$	Monoclinic (C2/m)
Calcium zirconium titanate (zirkelite)	$\text{CaZrTi}_2\text{O}_7$	Monoclinic (C2/m)
Calcium zirconium titanium silicate	$\text{Ca}_3(\text{Zr,Ti})\text{Si}_2\text{O}_9$	Monoclinic
Carbon (diamond)	C	Cubic (F-43m)
Cesium aluminum sulfate	$\text{CsAl}(\text{SO}_4)_2$	Trigonal (P321)
Cesium beryllium fluoride	$\text{Cs}_2\text{BeF}_4$	Orthorhombic (Pna2 <sub>1</sub> )
Cesium borate (CBO)	$\text{CsB}_3\text{O}_5$	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Cesium bromide	CsBr	Cubic (Fm3m)
Cesium cadmium bromide	$\text{Cs}_2\text{CdBr}_4$	Orthorhombic (Pnma)
Cesium cadmium bromide	$\text{CsCdBr}_3$	Cubic (Pm3m)
Cesium cadmium chloride	$\text{Cs}_2\text{CdCl}_4$	Tetragonal (I4/mmm)
Cesium cadmium fluoride	$\text{CsCdF}_3$	Cubic (Pm3m)
Cesium cadmium zinc fluoride	$\text{Cs}_2\text{CdZnF}_6$	Rhombohedral (R-3m)
Cesium calcium fluoride	$\text{CsCaF}_3$	Cubic (Pm3m)
Cesium chloride	CsCl	Cubic (Fm3m)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Cesium dideuterium arsenate	CsD <sub>2</sub> AsO <sub>4</sub>	Tetragonal (I–42m)
Cesium dideuterium phosphate	CsD <sub>2</sub> PO <sub>4</sub>	Tetragonal (I–42m)
Cesium dihydrogen arsenate	CsH <sub>2</sub> AsO <sub>4</sub>	Tetragonal (I–42m)
Cesium dihydrogen phosphate	CsH <sub>2</sub> PO <sub>4</sub>	Tetragonal (I–42m)
Cesium fluoride	CsF	Cubic (Fm3m)
Cesium gadolinium molybdate	CsGd(MoO <sub>4</sub> ) <sub>2</sub>	Orthorhombic (Pnma)
Cesium gallium sulfate	CsGa(SO <sub>4</sub> ) <sub>2</sub>	Trigonal (P321)
Cesium germanate	Ga <sub>2</sub> GeO <sub>5</sub>	Orthorhombic (Pnnm)
Cesium iodide	CsI	Cubic (Fm3m)
Cesium lanthanum tungstate	CsLa(WO <sub>4</sub> ) <sub>2</sub>	Tetragonal (P4 <sub>2</sub> /nmc)
Cesium lithium aluminum fluoride	Cs <sub>2</sub> LiAl <sub>3</sub> F <sub>12</sub>	Rhombohedral (R–3m)
Cesium lithium aluminum fluoride	Cs <sub>2</sub> LiAlF <sub>6</sub>	Hexagonal (P6 <sub>3</sub> /mmc)
Cesium lithium beryllium fluoride	CsLiBeF <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /n)
Cesium lithium borate (CLBO)	CsLiB <sub>6</sub> O <sub>10</sub>	Tetragonal (I–42d)
Cesium lithium gallium fluoride	Cs <sub>2</sub> LiGa <sub>3</sub> F <sub>12</sub>	Rhombohedral (R–3m)
Cesium lithium gallium fluoride	Cs <sub>2</sub> LiGaF <sub>6</sub>	Hexagonal (P6 <sub>3</sub> /mmc)
Cesium lithium sulfate	CsLiSO <sub>4</sub>	Orthorhombic (Pc2)
Cesium magnesium chloride	Cs <sub>2</sub> MgCl <sub>4</sub>	Orthorhombic (Pnma)
Cesium mercury iodide	Cs <sub>2</sub> HgI <sub>4</sub>	Monoclinic (P2 <sub>1</sub> )
Cesium niobium borate (CNB)	CsNbB <sub>2</sub> O <sub>6</sub>	Orthorhombic (Pn2 <sub>1</sub> m)
Cesium niobium sulfate	CsNbO(SO <sub>4</sub> ) <sub>2</sub>	Orthorhombic
Cesium potassium aluminum fluoride	Cs <sub>2</sub> KAl <sub>3</sub> F <sub>12</sub>	Rhombohedral (R–3m)
Cesium potassium lanthanum fluoride	Cs <sub>2</sub> KLaF <sub>6</sub>	Cubic (Fm3m)
Cesium scandium molybdate	CsSc(MoO <sub>4</sub> ) <sub>2</sub>	Trigonal (P–3m1)
Cesium scandium tungstate	CsSc(WO <sub>4</sub> ) <sub>2</sub>	Trigonal (P–3m1)
Cesium silver fluoride	Cs <sub>2</sub> AgF <sub>4</sub>	Tetragonal (I4/mmm)
Cesium sodium aluminum fluoride	Cs <sub>2</sub> NaAl <sub>3</sub> F <sub>12</sub>	Rhombohedral (R–3m)
Cesium sodium aluminum fluoride	Cs <sub>2</sub> NaAlF <sub>6</sub>	Rhombohedral (R–3m)
Cesium sodium gallium fluoride	Cs <sub>2</sub> NaGaF <sub>6</sub>	Rhombohedral (R–3m)
Cesium sodium yttrium fluoride	Cs <sub>2</sub> NaYF <sub>6</sub>	Cubic (Fm3m)
Cesium strontium fluoride	CsSrF <sub>3</sub>	Cubic (Pm3m)
Cesium tin germanate	Cs <sub>2</sub> SnGe <sub>3</sub> O <sub>9</sub>	Hexagonal (P6 <sub>3</sub> /m)
Cesium titanium germanate	Cs <sub>2</sub> TiGe <sub>3</sub> O <sub>9</sub>	Hexagonal (P6 <sub>3</sub> /m)
Cesium titano arsenate (CTA)	CsTiOAsO <sub>4</sub>	Orthorhombic (P2 <sub>1</sub> nb)
Cesium zinc aluminum fluoride	CsZnAlF <sub>6</sub>	Orthorhombic
Cesium zinc bromide	Cs <sub>2</sub> ZnBr <sub>4</sub>	Orthorhombic (Pnma)
Cesium zinc chloride	Cs <sub>2</sub> ZnCl <sub>4</sub>	Orthorhombic (Pnma)
Copper bromide (cuprous)	CuBr	Cubic (Fm3m)
Copper chloride (cuprous, nantokite)	CuCl	Cubic (Fm3m)
Copper iodide (cuprous, marshite)	CuI	Cubic (Fm3m)
Cuprous oxide (cuprite)	Cu <sub>2</sub> O	Cubic (Pm3m)
Gadolinium aluminate	Gd <sub>4</sub> Al <sub>2</sub> O <sub>9</sub>	Monoclinic (P2 <sub>1</sub> /a)
Gadolinium aluminate	GdAlO <sub>3</sub>	Orthorhombic (Pbnm)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Gadolinium aluminum borate	$\text{GdAl}_3(\text{BO}_3)_4$	Trigonal (R32)
Gadolinium aluminum germanate	$\text{GdAlGe}_2\text{O}_7$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium borate	$\text{Gd}(\text{BO}_2)_3$	Monoclinic (I2/a)
Gadolinium borate	$\text{GdBO}_3$	Hexagonal ( $\text{P}6_3/\text{mmc}$ )
Gadolinium calcium oxyborate	$\text{GdCa}_4\text{O}(\text{BO}_3)_3$	Monoclinic (Cm)
Gadolinium gallium borate	$\text{GdGa}_3(\text{BO}_3)_4$	Trigonal (R32)
Gadolinium gallium garnet (GGG)	$\text{Gd}_3\text{Ga}_5\text{O}_{12}$	Cubic (Ia3d)
Gadolinium gallium germanate	$\text{GdGaGe}_2\text{O}_7$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium germanate	$\text{Gd}_2\text{GeO}_5$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium germanium beryllate	$\text{Gd}_2\text{GeBe}_2\text{O}_7$	Tetragonal ( $\text{P}42_1\text{m}$ )
Gadolinium indate	$\text{GdInO}_3$	Hexagonal ( $\text{P}6_3\text{cm}$ )
Gadolinium magnesium borate	$\text{GdMgB}_5\text{O}_{10}$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium molybdate	$\text{Gd}_2(\text{MoO}_4)_3$	Orthorhombic (Pba2)
Gadolinium niobate	$\text{GdNbO}_4$	Monoclinic (I2/a)
Gadolinium niobate	$\text{Gd}_3\text{NbO}_7$	Orthorhombic ( $\text{C}222_1$ )
Gadolinium orthosilicate	$\text{Gd}_2\text{SiO}_5$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium oxide	$\text{Gd}_2\text{O}_3$	Monoclinic ( $\text{C}2/\text{m}$ )
Gadolinium oxymolybdate	$\text{Gd}_2\text{MoO}_6$	Monoclinic (I2/c)
Gadolinium oxysulfate	$\text{Gd}_2\text{O}_2\text{SO}_4$	Orthorhombic
Gadolinium oxytungstate	$\text{Gd}_2\text{WO}_6$	Monoclinic (I2/c)
Gadolinium pentaphosphate	$\text{GdP}_5\text{O}_{14}$	Monoclinic ( $\text{P}2_1/\text{c}$ )
Gadolinium phosphate	$\text{GdPO}_4$	Monoclinic ( $\text{P}2_1/\text{n}$ )
Gadolinium scandate	$\text{GdScO}_3$	Orthorhombic (Pbnm)
Gadolinium scandium aluminum garnet (GSAG)	$\text{Gd}_3\text{Sc}_2\text{Al}_3\text{O}_{12}$	Cubic (Ia3d)
Gadolinium scandium gallium garnet (GSGG)	$\text{Gd}_3\text{Sc}_2\text{Ga}_3\text{O}_{12}$	Cubic (Ia3d)
Gadolinium strontium borate	$\text{Gd}_2\text{Sr}_3(\text{BO}_3)_4$	Orthorhombic ( $\text{P}2_1\text{cn}$ )
Gadolinium tantalate	$\text{Gd}_3\text{TaO}_7$	Orthorhombic ( $\text{C}222_1$ )
Gadolinium titanate	$\text{Gd}_2\text{Ti}_2\text{O}_7$	Cubic (Fd3m)
Gadolinium tungstate	$\text{Gd}_2(\text{WO}_4)_3$	Monoclinic ( $\text{C}2/\text{c}$ )
Gadolinium vanadate	$\text{GdVO}_4$	Tetragonal ( $\text{I}4_1/\text{amd}$ )
Gallium antimonide	$\text{GaSb}$	Cubic (F-43m)
Gallium arsenide	$\text{GaAs}$	Cubic (F-43m)
Gallium germanate	$\alpha\text{-Ga}_4\text{GeO}_8$	Monoclinic ( $\text{C}2/\text{m}$ )
Gallium molybdate	$\text{Ga}_2(\text{MoO}_4)_3$	Monoclinic ( $\text{P}2_1/\text{a}$ )
Gallium niobate	$\text{GaNbO}_4$	Monoclinic ( $\text{C}2$ )
Gallium nitride - wurtzite	$\alpha\text{-GaN}$	Hexagonal ( $\text{P}6_3\text{mc}$ )
Gallium nitride - zincblende	$\beta\text{-GaN}$	Cubic (F-43m)
Gallium oxide	$\beta\text{-Ga}_2\text{O}_3$	Monoclinic ( $\text{A}2/\text{m}$ )
Gallium phosphate	$\text{GaPO}_4$	Trigonal ( $\text{P}3_12$ )
Gallium phosphide	$\text{GaP}$	Cubic (F-43m)
Gallium selenide	$\text{GaSe}$	Hexagonal ( $\text{P}-62\text{m}$ )
Gallium sulfide	$\text{GaS}$	Hexagonal ( $\text{P}-62\text{m}$ )
Gallium tungstate	$\text{Ga}_2(\text{WO}_4)_3$	Orthorhombic (Pcna)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Germanium	Ge	Cubic (F-43m)
Germanium oxide (argutite)	GeO <sub>2</sub>	Tetragonal (P4 <sub>2</sub> /mmn)
Hafnium oxide	HfO <sub>2</sub>	Monoclinic (P2 <sub>1</sub> /c)
Hafnium silicate (hafnon)	HfSiO <sub>4</sub>	Tetragonal (I4 <sub>1</sub> /amd)
Indium antimonide	InSb	Cubic (F-43m)
Indium arsenide	InAs	Cubic (F-43m)
Indium borate	InBO <sub>3</sub>	Rhombohedral (R-3c)
Indium cadmium borate	InCdBO <sub>4</sub>	Orthorhombic (Pnam)
Indium calcium borate	InCaBO <sub>4</sub>	Orthorhombic (Pnam)
Indium gallate	InGaO <sub>3</sub>	Monoclinic (C2/m)
Indium molybdate	In <sub>2</sub> (MoO <sub>4</sub> ) <sub>3</sub>	Monoclinic (P2 <sub>1</sub> /a)
Indium niobate	InNbO <sub>4</sub>	Monoclinic (P2/c)
Indium nitride	InN	Hexagonal (P6 <sub>3</sub> mc)
Indium oxide	In <sub>2</sub> O <sub>3</sub>	Rhombohedral (R3c)
Indium phosphate	InPO <sub>4</sub>	Orthorhombic (Cmcm)
Indium phosphide	InP	Cubic (F-43m)
Indium tantalate	InTaO <sub>4</sub>	Monoclinic (P2/c)
Indium tungstate	In <sub>2</sub> (WO <sub>4</sub> ) <sub>3</sub>	Orthorhombic (Pcna)
Indium vanadate	InVO <sub>4</sub>	Monoclinic (C2/m)
Iodic acid	HIO <sub>3</sub>	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Lanthanum aluminate	LaAlO <sub>3</sub>	Trigonal (R-3m)
Lanthanum aluminum germanate	LaAlGe <sub>2</sub> O <sub>7</sub>	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum aluminum germanate	LaAlGe <sub>2</sub> O <sub>7</sub>	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum antimonate	LaSbO <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum antimonate	La <sub>3</sub> SbO <sub>7</sub>	Orthorhombic (Cmcm)
Lanthanum barium borate	La <sub>2</sub> Ba <sub>3</sub> (BO <sub>3</sub> ) <sub>4</sub>	Orthorhombic (P2 <sub>1</sub> cn)
Lanthanum barium gallate	BaLaGa <sub>3</sub> O <sub>7</sub>	Tetragonal (P4 <sub>2</sub> 1m)
Lanthanum barium germanate	LaBaGa <sub>3</sub> O <sub>7</sub>	Tetragonal (P4 <sub>2</sub> 1m)
Lanthanum beryllate (BEL)	La <sub>2</sub> Be <sub>2</sub> O <sub>5</sub>	Monoclinic (C2/c)
Lanthanum borate	LaBO <sub>3</sub>	Orthorhombic (Pnam)
Lanthanum boron germanate	LaBGeO <sub>5</sub>	Trigonal (C3m)
Lanthanum boron molybdate	LaBMoO <sub>6</sub>	Monoclinic (P2 <sub>1</sub> )
Lanthanum boron silicate (stillwellite)	LaBSiO <sub>5</sub>	Trigonal (C3m)
Lanthanum boron tungstate	LaBWO <sub>6</sub>	Monoclinic (P2 <sub>1</sub> )
Lanthanum calcium aluminate	LaCaAl <sub>3</sub> O <sub>7</sub>	Tetragonal (P4 <sub>2</sub> 1m)
Lanthanum calcium borate	La <sub>2</sub> Ca <sub>3</sub> (BO <sub>3</sub> ) <sub>4</sub>	Orthorhombic (P2 <sub>1</sub> cn)
Lanthanum calcium gallate	LaCaGa <sub>3</sub> O <sub>7</sub>	Tetragonal (P4 <sub>2</sub> 1m)
Lanthanum chloride	LaCl <sub>3</sub>	Hexagonal (P6 <sub>3</sub> /m)
Lanthanum fluoride (tysonite)	LaF <sub>3</sub>	Trigonal (P-3c1)
Lanthanum gallate	LaGaO <sub>3</sub>	Orthorhombic (Pbnm)
Lanthanum gallium germanate	LaGaGe <sub>2</sub> O <sub>7</sub>	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum gallium germanate	La <sub>3</sub> Ga <sub>5</sub> GeO <sub>14</sub>	Trigonal (P32 <sub>1</sub> )
Lanthanum gallium silicate	La <sub>3</sub> Ga <sub>5</sub> SiO <sub>14</sub>	Trigonal (P32 <sub>1</sub> )

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Lanthanum germanium beryllate	$\text{La}_2\text{GeBe}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Lanthanum indate	$\text{LaInO}_3$	Orthorhombic (Pbnm)
Lanthanum lutetium gallium garnet (LLGG)	$\text{La}_3\text{Lu}_2\text{Ga}_3\text{O}_{12}$	Cubic (Ia3d)
Lanthanum magnesium borate	$\text{LaMgB}_5\text{O}_{10}$	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum magnesium hexa-aluminate (LMA)	$\text{LaMgAl}_{11}\text{O}_{19}$	Hexagonal (P6 <sub>3</sub> /mmc)
Lanthanum metaborate	$\text{LaB}_3\text{O}_6$	Monoclinic (I2/a)
Lanthanum molybdate	$\text{La}_2(\text{MoO}_4)_3$	Monoclinic (C2/c)
Lanthanum molybdate	$\text{La}_2(\text{MoO}_4)_3$	Tetragonal (I–42m)
Lanthanum niobate	$\text{LaNbO}_4$	Monoclinic (I2/a)
Lanthanum niobate	$\text{LaNb}_5\text{O}_{14}$	Orthorhombic (Pnam)
Lanthanum niobate	$\text{La}_3\text{NbO}_7$	Orthorhombic (Cmcm)
Lanthanum niobogallate	$\text{La}_3\text{Nb}_{0.5}\text{Ga}_{5.5}\text{O}_{14}$	Trigonal (P32 <sub>1</sub> )
Lanthanum oxide	$\text{La}_2\text{O}_3$	Trigonal (P–3m1)
Lanthanum oxybromide	$\text{LaOBr}$	Tetragonal (P4/nmm)
Lanthanum oxymolybdate	$\text{La}_2\text{MoO}_6$	Tetragonal (I–42m)
Lanthanum oxysulfate	$\text{La}_2\text{O}_2\text{SO}_4$	Orthorhombic
Lanthanum oxysulfide	$\text{La}_2\text{O}_2\text{S}$	Trigonal (P–3m)
Lanthanum oxytungstate	$\text{La}_2\text{WO}_6$	Hexagonal (P6 <sub>3</sub> /mmc)
Lanthanum pentaphosphate	$\text{LaP}_5\text{O}_{14}$	Orthorhombic (Pcmm)
Lanthanum phosphate (monazite)	$\text{LaPO}_4$	Monoclinic (P2 <sub>1</sub> /n)
Lanthanum scandate	$\text{LaScO}_3$	Orthorhombic (Pbnm)
Lanthanum scandium borate	$\text{LaSc}_3(\text{BO}_3)_4$	Monoclinic
Lanthanum silicate	$\text{La}_2\text{SiO}_5$	Monoclinic
Lanthanum strontium borate	$\text{La}_2\text{Sr}_3(\text{BO}_3)_4$	Orthorhombic (P2 <sub>1</sub> cn)
Lanthanum strontium gallate	$\text{LaSrGa}_3\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Lanthanum tantalate	$\text{La}_3\text{TaO}_7$	Orthorhombic (Cmcm)
Lanthanum tantalogallate	$\text{La}_3\text{Ta}_{0.5}\text{Ga}_{5.5}\text{O}_{14}$	Trigonal (P32 <sub>1</sub> )
Lanthanum titanate	$\text{La}_2\text{TiO}_5$	Orthorhombic (Pnam)
Lanthanum titanate	$\text{La}_2\text{Ti}_2\text{O}_7$	Monoclinic (P2 <sub>1</sub> /c)
Lanthanum tungstate	$\text{La}_2(\text{WO}_4)_3$	Monoclinic (C2/c)
Lanthanum yttrium tungstate	$\text{LaY}(\text{WO}_4)_3$	Monoclinic (C2/c)
Lanthanum vanadate	$\text{LaVO}_4$	Monoclinic (P2 <sub>1</sub> /c)
Lead antimonate	$\text{Pb}_2\text{Sb}_2\text{O}_7$	Cubic (Fd3m)
Lead bismuth niobate	$\text{PbBi}_2\text{Nb}_2\text{O}_9$	Orthorhombic (Fmm2)
Lead bromide	$\text{PbBr}_2$	Orthorhombic (Pnma)
Lead cadmium niobate	$\text{Pb}_3\text{CdNb}_2\text{O}_9$	Orthorhombic
Lead calcium chloroarsenate (hedyphane)	$\text{Pb}_3\text{Ca}_2(\text{AsO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Lead carbonate (cerussite)	$\text{PbCO}_3$	Orthorhombic (Pnam)
Lead chloride (cotunnite)	$\text{PbCl}_2$	Orthorhombic (Pnam)
Lead chloroarsenate (mimetite)	$\text{Pb}_5(\text{AsO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Lead chlorophosphate (pyromorphite)	$\text{Pb}_5(\text{PO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Lead chlorovanadate (vanadinite)	$\text{Pb}_5(\text{VO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Lead fluoride	$\text{PbF}_2$	Cubic (Fm3m)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Lead fluoroarsenate	$\text{Pb}_5(\text{AsO}_4)_3\text{F}$	Hexagonal ( $\text{P6}_3/\text{m}$ )
Lead fluorophosphate	$\text{Pb}_5(\text{PO}_4)_3\text{F}$	Hexagonal ( $\text{P6}_3/\text{m}$ )
Lead fluorovanadate	$\text{Pb}_5(\text{VO}_4)_3\text{F}$	Hexagonal ( $\text{P6}_3/\text{m}$ )
Lead germanate	$\text{PbGeO}_3$	Monoclinic ( $\text{P2}_1/\text{a}$ )
Lead germanate	$\text{Pb}_3\text{GeO}_5$	Monoclinic ( $\text{P12}$ )
Lead germanate	$\text{Pb}_3\text{Ge}_3\text{O}_{11}$	Trigonal ( $\text{P3}$ )
Lead germanate	$\text{Pb}_5\text{Ge}_2\text{O}_7$	Hexagonal
Lead hafnate	$\text{PbHfO}_3$	Orthorhombic ( $\text{Pbam}$ )
Lead hexa-aluminate (magnetoplumbite)	$\text{PbAl}_{12}\text{O}_{19}$	Hexagonal ( $\text{P6}_3/\text{mmc}$ )
Lead indium niobate	$\text{Pb}_2\text{InNbO}_6$	Rhombohedral
Lead iodide	$2H\text{-PbI}_2$	Trigonal ( $\text{P3m1}$ )
Lead magnesium niobate	$\text{Pb}_3\text{MgNb}_2\text{O}_9$	Orthorhombic
Lead molybdate (wulfenite)	$\text{PbMoO}_4$	Tetragonal ( $\text{I4}_1/\text{a}$ )
Lead niobate (changbaiite)	$\text{PbNb}_2\text{O}_6$	Orthorhombic ( $\text{Cm2m}$ )
Lead nitrate	$\text{Pb}(\text{NO}_3)_2$	Cubic ( $\text{Pa3}$ )
Lead oxide (litharge)	$\text{PbO}$	Tetragonal ( $\text{P4/nmm}$ )
Lead oxide (massicot)	$\text{PbO}$	Orthorhombic ( $\text{Pbcm}$ )
Lead phosphate	$\text{Pb}_3(\text{PO}_4)_2$	Monoclinic ( $\text{PC2/c}$ )
Lead potassium niobate	$\text{Pb}_2\text{KNb}_5\text{O}_{15}$	Orthorhombic ( $\text{Im2m}$ )
Lead scandium niobate	$\text{Pb}_2\text{ScNbO}_6$	Rhombohedral
Lead selenate (kerstenite)	$\text{PbSeO}_4$	Orthorhombic ( $\text{Pnma}$ )
Lead selenide (clausthalite)	$\text{PbSe}$	Cubic ( $\text{Fm3m}$ )
Lead selenite (molybdomenite)	$\text{PbSeO}_3$	Monoclinic
Lead silicate (alamosite)	$\text{PbSiO}_3$	Monoclinic ( $\text{Pn}$ )
Lead sodium niobate	$\text{PbNaNb}_5\text{O}_{15}$	Orthorhombic ( $\text{Im2a}$ )
Lead sulfate (anglesite)	$\text{PbSO}_4$	Orthorhombic ( $\text{Pnma}$ )
Lead sulfide (galena)	$\text{PbS}$	Cubic ( $\text{Fm3m}$ )
Lead tantalate	$\text{PbTa}_2\text{O}_6$	Orthorhombic ( $\text{Cm2m}$ )
Lead telluride (altaite)	$\text{PbTe}$	Cubic ( $\text{Fm3m}$ )
Lead titanate (macedonite)	$\text{PbTiO}_3$	Tetragonal ( $\text{P4mm}$ )
Lead titanium phosphate	$\text{PbTiP}_2\text{O}_8$	Orthorhombic
Lead tungstate (stolzite)	$\text{PbWO}_4$	Tetragonal ( $\text{I4}_1/\text{a}$ )
Lead vanadate	$\text{Pb}_3(\text{VO}_4)_2$	Monoclinic ( $\text{P2/c}$ )
Lead vanadate (chervetite)	$\text{Pb}_2\text{V}_2\text{O}_7$	Monoclinic ( $\text{P21/a}$ )
Lead zinc niobate	$\text{Pb}_3\text{ZnNb}_2\text{O}_9$	Orthorhombic
Lead zinc silicate	$\text{Pb}_2\text{ZnSi}_2\text{O}_7$	Tetragonal ( $\text{P421m}$ )
Lead zinc silicate (larsenite)	$\text{PbZnSiO}_4$	Orthorhombic ( $\text{Pnam}$ )
Lithium aluminate	$\text{Li}_5\text{AlO}_4$	Orthorhombic ( $\text{Pbca}$ )
Lithium aluminate	$\gamma\text{-LiAlO}_2$	Tetragonal ( $\text{P4}_12_12$ )
Lithium aluminate spinel	$\text{LiAl}_5\text{O}_8$	Cubic ( $\text{P4}_132$ )
Lithium aluminum borate	$\text{Li}_6\text{Al}_2(\text{BO}_3)_4$	Triclinic ( $\text{P}-1$ )
Lithium aluminum fluorophosphate (amblygonite)	$\text{LiAl}(\text{PO}_4)\text{F}$	Triclinic ( $\text{P}-1$ )
Lithium aluminum germanate	$\text{LiAlGe}_2\text{O}_6$	Monoclinic ( $\text{P21/n}$ )

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Lithium aluminum germanate	$\text{LiAlGeO}_4$	Trigonal(R-3)
Lithium aluminum molybdate	$\text{LiAl}(\text{MoO}_4)_2$	Triclinic(P-1)
Lithium aluminum silicate	$\text{LiAlSi}_2\text{O}_6$	Monoclinic (C2/c)
Lithium aluminum silicate	$\text{LiAlSi}_4\text{O}_{10}$	Monoclinic (P2 <sub>1</sub> /n)
Lithium aluminum silicate (eucryptite)	$\text{LiAlSiO}_4$	Rhombohedral(R-3)
Lithium aluminum silicate (petalite)	$\text{LiAlSi}_4\text{O}_{10}$	Monoclinic (P2 <sub>1</sub> /n)
Lithium aluminum silicate (spodumene)	$\text{LiAlSi}_2\text{O}_6$	Rhombohedral(R-3)
Lithium barium aluminum fluoride (LiBAF)	$\text{LiBaAlF}_6$	Monoclinic (P2 <sub>1</sub> /a)
Lithium barium fluoride	$\text{LiBaF}_3$	Cubic (Pm3m)
Lithium barium gallium fluoride	$\text{LiBaGaF}_6$	Monoclinic (P2 <sub>1</sub> /a)
Lithium beryllium fluoride	$\text{Li}_2\text{BeF}_4$	Cubic (Fd3m)
Lithium beryllium silicate (liberite)	$\text{Li}_2\text{BeSiO}_4$	Monoclinic (Pn)
Lithium borate	$\text{LiBO}_2$	Monoclinic (P2 <sub>1</sub> /c)
Lithium borate	$\text{LiB}_3\text{O}_5$	Orthorhombic (Pna2 <sub>1</sub> )
Lithium bromide	$\text{LiBr}$	Cubic (Fm3m)
Lithium cadmium borate	$\text{LiCdBO}_3$	Hexagonal (P-6)
Lithium cadmium chloride	$\text{Li}_2\text{CdCl}_4$	Cubic (Fd3m)
Lithium cadmium indium fluoride	$\text{LiCdInF}_6$	Trigonal (P321)
Lithium calcium aluminum fluoride (LiCAF)	$\text{LiCaAlF}_6$	Trigonal(P-31c)
Lithium calcium gallium fluoride (LiCGaF)	$\text{LiCaGaF}_6$	Trigonal(P-31c)
Lithium calcium germanate	$\text{Li}_2\text{CaGeO}_4$	Tetragonal (I-42m)
Lithium calcium indium fluoride	$\text{LiCaInF}_6$	Trigonal (P321)
Lithium calcium silicate	$\text{Li}_2\text{CaSiO}_4$	Tetragonal (I-42m)
Lithium carbonate (zabuyelite)	$\text{Li}_2\text{CO}_3$	Monoclinic (C2/c)
Lithium chloride	$\text{LiCl}$	Cubic (Fm3m)
Lithium fluoride (griceite)	$\text{LiF}$	Cubic (Fm3m)
Lithium gadolinium borate	$\text{Li}_3\text{Gd}_2(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /n)
Lithium gadolinium borate	$\text{Li}_6\text{Gd}(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /b)
Lithium gadolinium molybdate	$\text{LiGd}(\text{MoO}_4)_2$	Tetragonal (I4 <sub>1</sub> /a)
Lithium gadolinium molybdate	$\text{LiGd}(\text{MoO}_4)_2$	Tetragonal (I4 <sub>1</sub> /a)
Lithium gadolinium oxide	$\text{LiGdO}_2$	Orthorhombic (Pnma)
Lithium gadolinium tetrafluoride (GLF)	$\text{LiGdF}_4$	Tetragonal (I4 <sub>1</sub> /a)
Lithium gadolinium tetraphosphate	$\text{LiGdP}_4\text{O}_{12}$	Monoclinic (I2/c)
Lithium gadolinium tungstate	$\text{LiGd}(\text{WO}_4)_2$	Tetragonal (I4 <sub>1</sub> /a)
Lithium gallate	$\text{LiGaO}_2$	Orthorhombic (Pna2 <sub>1</sub> )
Lithium gallate	$\text{Li}_5\text{GaO}_4$	Orthorhombic (Pnam)
Lithium gallate spinel	$\text{LiGa}_5\text{O}_8$	Cubic (P4 <sub>1</sub> 32)
Lithium gallium germanate	$\text{LiGaGe}_2\text{O}_6$	Monoclinic (P2 <sub>1</sub> /c)
Lithium gallium germanate	$\text{LiGaGe}_2\text{O}_6$	Monoclinic (P2 <sub>1</sub> /c)
Lithium gallium germanate	$\text{LiGaGeO}_4$	Trigonal(R-3)
Lithium gallium silicate	$\text{LiGaSi}_2\text{O}_6$	Monoclinic (C2/c)
Lithium gallium silicate	$\text{LiGaSiO}_4$	Rhombohedral(R-3)
Lithium gallium tungstate	$\text{LiGa}(\text{WO}_4)_2$	Monoclinic (P2/c)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Lithium germanate	$\text{Li}_2\text{GeO}_3$	Orthorhombic (Cmc2 <sub>1</sub> )
Lithium indium germanate	$\text{LiInGe}_2\text{O}_6$	Orthorhombic (Pbca)
Lithium indium molybdate	$\text{LiIn}(\text{MoO}_4)_2$	Monoclinic (P2 <sub>1</sub> /c)
Lithium indium oxide	$\text{Li}_3\text{InO}_3$	Trigonal (P-3c1)
Lithium indium oxide	$\text{LiInO}_2$	Tetragonal (I4 <sub>1</sub> /amd)
Lithium indium silicate	$\text{LiInSiO}_4$	Orthorhombic (Pnma)
Lithium indium silicate	$\text{LiInSi}_2\text{O}_6$	Monoclinic (C2/c)
Lithium indium tungstate	$\text{LiIn}(\text{WO}_4)_2$	Monoclinic (P2/c)
Lithium iodate	$\alpha\text{-LiIO}_3$	Hexagonal (P6 <sub>3</sub> )
Lithium iodide	$\text{LiI}$	Cubic (Fm3m)
Lithium lanthanum borate	$\text{Li}_3\text{La}_2(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /n)
Lithium lanthanum molybdate	$\text{LiLa}(\text{MoO}_4)_2$	Orthorhombic (Pbca)
Lithium lanthanum oxide	$\text{LiLaO}_2$	Orthorhombic (Pbmm)
Lithium lanthanum tetraphosphate	$\text{LiLaP}_4\text{O}_{12}$	Monoclinic (I2/c)
Lithium lanthanum tungstate	$\text{LiLa}(\text{WO}_4)_2$	Tetragonal (I4 <sub>1</sub> /a)
Lithium lutetium borate	$\text{Li}_6\text{Lu}(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /b)
Lithium lutetium fluoride	$\text{LiLuF}_4$	Tetragonal (I4 <sub>1</sub> /a)
Lithium lutetium germanate	$\text{LiLuGeO}_4$	Orthorhombic (Pbcn)
Lithium lutetium oxide	$\text{LiLuO}_2$	Tetragonal (I4 <sub>1</sub> /amd)
Lithium lutetium silicate	$\text{LiLuSiO}_4$	Orthorhombic (Pbcn)
Lithium lutetium tetraphosphate	$\text{LiLuP}_4\text{O}_{12}$	Monoclinic (I2/c)
Lithium lutetium tungstate	$\text{LiLu}(\text{WO}_4)_2$	Monoclinic (P2/c)
Lithium magnesium aluminum fluoride	$\text{LiMgAlF}_6$	Trigonal (P321)
Lithium magnesium borate	$\text{LiMgBO}_3$	Monoclinic (C2/c)
Lithium magnesium borate	$\text{Li}_2\text{MgB}_2\text{O}_5$	Monoclinic
Lithium magnesium chloride	$\text{Li}_2\text{MgCl}_4$	Cubic (Fd3m)
Lithium magnesium gallium fluoride	$\text{LiMgGaF}_6$	Tetragonal (P4 <sub>2</sub> /mmm)
Lithium magnesium germanate	$\text{Li}_2\text{MgGeO}_4$	Orthorhombic (Pmn2 <sub>1</sub> )
Lithium magnesium indium fluoride	$\text{LiMgInF}_6$	Trigonal (P321)
Lithium niobate	$\text{LiNbO}_3$	Trigonal (R3c)
Lithium phosphate (lithiophosphate)	$\text{Li}_3\text{PO}_4$	Orthorhombic
Lithium scandate	$\text{LiScO}_2$	Tetragonal (I4 <sub>1</sub> /amd)
Lithium scandium germanate	$\text{LiScGeO}_4$	Orthorhombic (Pbnm)
Lithium scandium germanate	$\text{LiScGe}_2\text{O}_6$	Orthorhombic (Pbca)
Lithium scandium silicate	$\text{LiScSiO}_4$	Orthorhombic (Pbnm)
Lithium scandium silicate	$\text{LiScSi}_2\text{O}_6$	Monoclinic (C2/c)
Lithium scandium tungstate	$\text{LiSc}(\text{WO}_4)_2$	Monoclinic (P2/c)
Lithium silicate	$\text{Li}_2\text{SiO}_3$	Orthorhombic (Ccm2 <sub>1</sub> )
Lithium strontium aluminum fluoride (LiSAF)	$\text{LiSrAlF}_6$	Trigonal (P-31c)
Lithium strontium gallium fluoride (LiSGF)	$\text{LiSrGaF}_6$	Trigonal (P-31c)
Lithium tantalate (LT)	$\text{LiTaO}_3$	Trigonal (R3c)
Lithium tetraborate (diomignite)	$\text{Li}_2\text{B}_4\text{O}_7$	Tetragonal (I4 <sub>1</sub> cd)
Lithium triborate (LBO)	$\text{LiB}_3\text{O}_5$	Orthorhombic (Pn2 <sub>1</sub> a)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Lithium vanadate	$\text{LiVO}_3$	Monoclinic (C2/c)
Lithium vanadate	$\text{Li}_3\text{VO}_4$	Orthorhombic (Pmn2 <sub>1</sub> )
Lithium yttrium borate	$\text{Li}_3\text{Y}_2(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /n)
Lithium yttrium borate	$\text{Li}_6\text{Y}(\text{BO}_3)_3$	Monoclinic (P2 <sub>1</sub> /b)
Lithium yttrium fluoride (YLF)	$\text{LiYF}_4$	Tetragonal (I4 <sub>1</sub> /a)
Lithium yttrium germanate	$\text{LiYGeO}_4$	Orthorhombic (Pbcn)
Lithium yttrium oxide	$\text{LiYO}_2$	Monoclinic (P2 <sub>1</sub> /c)
Lithium yttrium silicate	$\text{LiYSiO}_4$	Orthorhombic (Pbcn)
Lithium yttrium tungstate	$\text{LiY}(\text{WO}_4)_2$	Monoclinic (P2/c)
Lithium zinc borate	$\text{LiZnBO}_3$	Monoclinic (C2/c)
Lithium zinc indium fluoride	$\text{LiZnInF}_6$	Trigonal (P321)
Lithium zinc niobate	$\text{LiZnNbO}_4$	Tetragonal (P4 <sub>1</sub> 22)
Lutetium aluminum borate	$\text{LuAl}_3(\text{BO}_3)_3$	Trigonal (R32)
Lutetium aluminum garnet	$\text{Lu}_3\text{Al}_5\text{O}_{12}$	Cubic (Ia3d)
Lutetium borate	$\text{LuBO}_3$	Rhombohedral (R-3c)
Lutetium calcium borate	$\text{LuCaBO}_4$	Orthorhombic (Pnam)
Lutetium gallium garnet	$\text{Lu}_3\text{Ga}_5\text{O}_{12}$	Cubic (Ia3d)
Lutetium molybdate	$\text{Lu}_2(\text{MoO}_4)_3$	Orthorhombic (Pbcn)
Lutetium orthosilicate	$\text{Lu}_2\text{SiO}_5$	Monoclinic (C2/c)
Lutetium oxide	$\text{Lu}_2\text{O}_3$	Cubic (Ia3)
Lutetium oxymolybdate	$\text{Lu}_2\text{MO}_6$	Monoclinic (I2/c)
Lutetium oxysulfate	$\text{Lu}_2\text{O}_2\text{SO}_4$	Orthorhombic
Lutetium oxytungstate	$\text{Lu}_2\text{WO}_6$	Monoclinic (P2/c)
Lutetium pentaphosphate	$\text{LuP}_5\text{O}_{14}$	Monoclinic (C2/c)
Lutetium phosphate	$\text{LuPO}_4$	Tetragonal (I4 <sub>1</sub> /amd)
Lutetium scandate	$\text{LuScO}_3$	Cubic (Ia3)
Lutetium scandium aluminum garnet (LSAG)	$\text{Lu}_3\text{Sc}_2\text{Al}_3\text{O}_{12}$	Cubic (Ia3d)
Lutetium tantalate	$\text{LuTaO}_4$	Monoclinic (P2/a)
Lutetium titanate	$\text{Lu}_2\text{Ti}_2\text{O}_3$	Cubic (Fd3m)
Lutetium tungstate	$\text{Lu}_2(\text{WO}_4)_3$	Orthorhombic (Pcna)
Lutetium vanadate	$\text{LuVO}_4$	Tetragonal (I4 <sub>1</sub> /amd)
Magnesium aluminate (spinel)	$\text{MgAl}_2\text{O}_4$	Cubic (Fd3m)
Magnesium aluminum borate (sinhalite)	$\text{MgAlBO}_4$	Orthorhombic (Pnma)
Magnesium aluminum borosilicate (grandidierite)	$\text{MgAl}_3\text{BSiO}_9$	Orthorhombic
Magnesium aluminum silicate (cordierite)	$\text{Mg}_2\text{Al}_3(\text{Si}_5\text{Al})\text{O}_{18}$	Hexagonal (P6/mcc)
Magnesium aluminum silicate (sapphirine)	$\text{Mg}_4\text{Al}_8\text{Si}_2\text{O}_{20}$	Monoclinic (P2 <sub>1</sub> /a)
Magnesium aluminum silicate garnet (pyrope)	$\text{Mg}_3\text{Al}_2\text{Si}_3\text{O}_{12}$	Cubic (Ia3d)
Magnesium borate (kotoite)	$\text{Mg}_3\text{B}_2\text{O}_6$	Orthorhombic (Pnma)
Magnesium borate (suanite)	$\text{Mg}_2\text{B}_2\text{O}_5$	Monoclinic
Magnesium carbonate (magnesite)	$\text{MgCO}_3$	Rhombohedral (R-3c)
Magnesium chloroborate (boracite)	$\text{Mg}_3\text{B}_7\text{O}_{13}\text{Cl}$	Orthorhombic
Magnesium fluoride (sellaite, Irtran 1)	$\text{MgF}_2$	Tetragonal (P4 <sub>2</sub> /mmn)
Magnesium fluoroborate	$\text{Mg}_2\text{BO}_3\text{F}$	Orthorhombic

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Magnesium fluoroborate	$\text{Mg}_5(\text{BO}_3)_3\text{F}$	Orthorhombic (P*nb)
Magnesium fluorophosphate (wagnerite)	$\text{Mg}_2\text{PO}_4\text{F}$	Monoclinic (P2 <sub>1</sub> /a)
Magnesium gallate spinel	$\text{MgGa}_2\text{O}_4$	Cubic (Fd3m)
Magnesium gallium borate	$\text{MgGaBO}_4$	Orthorhombic (Pnam)
Magnesium gallium germanate	$\text{Mg}_4\text{Ga}_8\text{Ge}_2\text{O}_{20}$	Monoclinic (P2 <sub>1</sub> /a)
Magnesium germanate	$\text{MgGeO}_3$	Orthorhombic (Pbca)
Magnesium germanate	$\text{Mg}_2\text{GeO}_4$	Orthorhombic (Pnma)
Magnesium molybdate	$\text{MgMoO}_4$	Monoclinic (C2/m)
Magnesium oxide (periclase, Irtran 5)	$\text{MgO}$	Cubic (Fm3m)
Magnesium phosphate (farringtonite)	$\text{Mg}_3(\text{PO}_4)_2$	Monoclinic
Magnesium pyroarsenate	$\text{Mg}_2\text{As}_2\text{O}_7$	Monoclinic (C2/m)
Magnesium silicate (enstatite)	$\text{MgSiO}_3$	Monoclinic (P2 <sub>1</sub> /c)
Magnesium silicate (forsterite)	$\text{Mg}_2\text{SiO}_4$	Orthorhombic (Pbcn)
Magnesium titanate	$\text{MgTi}_2\text{O}_5$	Orthorhombic (Bbmm)
Magnesium titanate	$\text{Mg}_2\text{TiO}_4$	Cubic (Fd3m)
Magnesium titanate (geikielite)	$\text{MgTiO}_3$	Trigonal(R-3)
Magnesium titanium sulfate	$\text{MgTi}(\text{SO}_4)_2$	Monoclinic (P2 <sub>1</sub> /n)
Magnesium titanium borate (warwickite)	$\text{Mg}_3\text{TiB}_2\text{O}_8$	Orthorhombic
Magnesium tungstate	$\text{MgWO}_4$	Monoclinic (P2/c)
Magnesium vanadate	$\text{MgV}_2\text{O}_6$	Orthorhombic (Pbcn)
Magnesium vanadate	$\text{MgVO}_3$	Monoclinic (Cmc2 <sub>1</sub> )
Magnesium vanadate	$\text{Mg}_2\text{V}_2\text{O}_7$	Monoclinic (C2/m)
Magnesium vanadate	$\text{Mg}_3(\text{VO}_4)_2$	Orthorhombic (Cmca)
Manganese fluoride	$\text{MnF}_2$	Tetragonal (P4 <sub>2</sub> /mmn)
Manganese oxide (manganosite)	$\text{MnO}$	Cubic (Fm3m)
Mercurous bromide (kuzminite)	$\text{Hg}_2\text{Br}_2$	Tetragonal (I4/mmm)
Mercurous chloride (calomel)	$\text{Hg}_2\text{Cl}_2$	Tetragonal (I4/mmm)
Mercurous iodide (moschelite)	$\text{Hg}_2\text{I}_2$	Tetragonal (I4/mmm)
Mercury antimonate	$\text{Hg}_2\text{Sb}_2\text{O}_7$	Cubic (Fd3m)
Mercury chloride	$\text{HgCl}_2$	Orthorhombic (Pmnb)
Mercury iodide	$\text{HgI}_2$	Tetragonal (P4 <sub>2</sub> /mmc)
Mercury oxide	$\text{HgO}$	Orthorhombic (Pmna)
Mercury peroxide	$\text{Hg}_2\text{O}_2$	Monoclinic (C2/m)
Mercury selenide (tiemannite)	$\text{HgSe}$	Cubic (F43m)
Mercury sulfide (cinnabar)	$\text{HgS}$	Trigonal (R32)
Mercury tellurite (coloradoite)	$\text{HgTe}$	Cubic (F43m)
Neodymium calcium aluminum oxide	$\text{NdCaAlO}_4$	Tetragonal (I4/mmm)
Neodymium gallate	$\text{NbGaO}_3$	Orthorhombic (Pbnm)
Neodymium yttrium aluminum borate	$\text{Nd}_x\text{Y}_{1-x}\text{Al}_3(\text{BO}_3)_4$	Trigonal (R32)
Niobium phosphate	$\text{NbOPO}_4$	Tetragonal (P4/n)
Potassium aluminum borate	$\text{K}_2\text{A}_2\text{IB}_2\text{O}_7$	Trigonal (P321)
Potassium aluminum fluoride	$\text{K}_3\text{AlF}_6$	Cubic (Pm3m)
Potassium aluminum germanate	$\text{KAlGeO}_4$	Hexagonal (P6 <sub>3</sub> )

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Potassium aluminum molybdate	$\text{KAl}(\text{MoO}_4)_2$	Trigonal (P-3m1)
Potassium aluminum silicate (kaliophilite)	$\text{KAlSiO}_4$	Hexagonal (P6 <sub>3</sub> )
Potassium aluminum silicate (leucite)	$\text{KAlSi}_2\text{O}_6$	Tetragonal (I4 <sub>1</sub> /a)
Potassium aluminum silicate (orthoclase)	$\text{KAlSi}_3\text{O}_8$	Monoclinic (C2/m)
Potassium aluminum silicate hydroxide (mica)	$\text{KAl}_3\text{Si}_3\text{O}_{10} \cdot (\text{OH})_2$	Monoclinic
Potassium aluminum sulfate	$\text{KAl}(\text{SO}_4)_2$	Trigonal (P321)
Potassium aluminum tetrafluoride	$\text{KAlF}_4$	Tetragonal (P4/mbm)
Potassium beryllium fluoride	$\text{K}_2\text{BeF}_4$	Orthorhombic (Pna2 <sub>1</sub> )
Potassium beryllium fluoroborate (KBBF)	$\text{KBe}_2\text{BO}_3\text{F}_2$	Trigonal (R32)
Potassium bismuth niobate	$\text{KBiNb}_5\text{O}_{15}$	Tetragonal
Potassium boron fluoride (avogadvite)	$\text{KBF}_4$	Orthorhombic (Cmcm)
Potassium bromide	$\text{KBr}$	Cubic (Fm3m)
Potassium cadmium fluoride	$\text{KCdF}_3$	Cubic (Pm3m)
Potassium calcium fluoride	$\text{KCaF}_3$	Cubic (Pm3M)
Potassium calcium silicate	$\text{K}_2\text{CaSiO}_4$	Orthorhombic (Pnmm)
Potassium calcium zirconium silicate (wadeite)	$\text{K}_2\text{CaZr}(\text{SiO}_3)_4$	Hexagonal (P6 <sub>3</sub> m)
Potassium chloride (sylvite)	$\text{KCl}$	Cubic (Fm3m)
Potassium dideuterium phosphate (KDP)	$\text{KD}_2\text{PO}_4$	Hexagonal (P6 <sub>3</sub> )
Potassium dihydrogen phosphate (KDP)	$\text{KH}_2\text{PO}_4$	Tetragonal (I-42m)
Potassium fluoride (carobbiite)	$\text{KF}$	Cubic (Fm3m)
Potassium gadolinium niobate	$\text{K}_2\text{GdNb}_5\text{O}_{15}$	Tetragonal
Potassium gadolinium tungstate	$\text{KGd}(\text{WO}_4)_2$	Monoclinic (C2/c)
Potassium gadolinium vanadate	$\text{K}_3\text{Gd}(\text{VO}_4)_2$	Monoclinic (P2 <sub>1</sub> /m)
Potassium gallium germanate	$\text{KGaGeO}_4$	Hexagonal (P6 <sub>3</sub> )
Potassium gallium silicate	$\text{KGaSi}_3\text{O}_8$	Monoclinic (C2/m)
Potassium gallium silicate	$\text{KGaSiO}_4$	Hexagonal (P6 <sub>3</sub> )
Potassium indium molybdate	$\text{KIn}(\text{MoO}_4)_2$	Orthorhombic (Pnam)
Potassium indium tungstate	$\text{KIn}(\text{WO}_4)_2$	Trigonal (P-3m1)
Potassium iodide	$\text{KI}$	Cubic (Fm3m)
Potassium iodide	$\text{KIO}_3$	Monoclinic (P1)
Potassium lanthanum molybdate	$\text{KLa}(\text{MoO}_4)_4$	Tetragonal (I4 <sub>1</sub> /a)
Potassium lanthanum niobate	$\text{K}_2\text{LaNb}_5\text{O}_{15}$	Tetragonal
Potassium lanthanum phosphate	$\text{K}_3\text{La}(\text{PO}_4)_2$	Monoclinic (P2 <sub>1</sub> /m)
Potassium lanthanum tetraphosphate	$\text{KLaP}_4\text{O}_{12}$	Monoclinic (P2 <sub>1</sub> )
Potassium lanthanum tungstate	$\text{KLa}(\text{WO}_4)_2$	Monoclinic (C2/m)
Potassium lead chloride	$\text{KPb}_2\text{Cl}_5$	Monoclinic (P2 <sub>1</sub> /c)
Potassium lithium beryllium fluoride	$\text{KLiBeF}_4$	Hexagonal (P-3m1)
Potassium lithium gadolinium fluoride (KLGf)	$\text{KLiGdF}_5$	Monoclinic (P2 <sub>1</sub> /c)
Potassium lithium niobate (KLN)	$\text{K}_3\text{Li}_2\text{Nb}_5\text{O}_{15}$	Tetragonal (P4bm)
Potassium lithium yttrium fluoride (KLYF)	$\text{KLiYF}_5$	Monoclinic (P21/c)
Potassium lutetium tungstate	$\text{KLu}(\text{WO}_4)_4$	Monoclinic (C2/c)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Potassium lutetium vanadate	$K_3Lu(VO_4)_4$	Monoclinic (P2 <sub>1</sub> /m)
Potassium magnesium chloride	$K_2MgCl_4$	Tetragonal (I4/mmm)
Potassium magnesium fluoride	$K_2MgF_4$	Tetragonal (I4/mmm)
Potassium magnesium fluoride	$KMgF_3$	Cubic (Pm3m)
Potassium magnesium sulfate (langbeinite)	$K_2Mg_2(SO_4)_3$	Cubic (P2 <sub>1</sub> 3)
Potassium niobate (KN)	$KNbO_3$	Orthorhombic (Amm2)
Potassium niobium borate	$KNbB_2O_6$	Orthorhombic (Pn2 <sub>1</sub> m)
Potassium nitrate (nitre)	$KNO_3$	Orthorhombic (Pmcn)
Potassium pentaborate	$KB_5O_8 \cdot 4H_2O$	Orthorhombic (Aba2)
Potassium scandium molybdate	$KSc(MoO_4)_2$	Tetragonal (P–3m1)
Potassium scandium tungstate	$KSc(WO_4)_2$	Trigonal (P–3m1)
Potassium scandium vanadate	$KSc(VO_4)_2$	Trigonal
Potassium sodium aluminum fluoride (elpasolite)	$K_2NaAlF_6$	Cubic (Fm3m)
Potassium sodium gallium fluoride	$K_2NaGaF_6$	Cubic (Fm3m)
Potassium sodium lithium niobate	$KNaLi_2Nb_5O_{15}$	Trigonal
Potassium sodium lithum niobate	$K_2NaLi_2Nb_5O_{15}$	Tetragonal (P4bm)
Potassium strontium sulfate (kalistrontite)	$K_2Sr(SO_4)_2$	Trigonal
Potassium tantalate	$KTaO_3$	Cubic (Pm–3m)
Potassium tantalum borate	$KTaB_2O_6$	Orthorhombic (Pmm)
Potassium tin germanate	$K_2SnGe_3O_9$	Trigonal (P–3c1)
Potassium tin silicate	$K_2SnSi_3O_9$	Hexagonal (P6 <sub>3</sub> /m)
Potassium titanium germanate	$K_2TiGe_3O_9$	Trigonal (P–3c1)
Potassium titanium niobate	$KTiNbO_5$	Orthorhombic (Pnma)
Potassium titanium niobate	$KTi_3NbO_9$	Orthorhombic (Pnmm)
Potassium titanioarsenate (KTA)	$KTiOAsO_4$	Orthorhombic (P2 <sub>1</sub> nb)
Potassium titanophosphate (KTP)	$KTiOPO_4$	Orthorhombic (P2 <sub>1</sub> nb)
Potassium titanium silicate	$K_2TiSi_3O_9$	Hexagonal (P6 <sub>3</sub> /m)
Potassium vanadate	$KVO_3$	Orthorhombic (Pmab)
Potassium yttrium fluoride	$KY_3F_{10}$	Cubic (Fm3m)
Potassium yttrium molybdate	$KY(MoO_4)_2$	Orthorhombic (Pbna)
Potassium yttrium niobate	$K_2YNb_5O_{15}$	Tetragonal
Potassium yttrium tetrafluoride (KYF)	$KYF_4$	Trigonal (P3 <sub>1</sub> )
Potassium yttrium tungstate	$KY(WO_4)_2$	Monoclinic (C2/c)
Potassium yttrium vanadate	$K_3Y(VO_4)_2$	Monoclinic
Potassium zinc fluoride	$K_2ZnF_4$	Tetragonal (I4/mmm)
Potassium zinc fluoride	$KZnF_3$	Tetragonal
Rubidium aluminum selenate	$RbAl(SeO_4)_2$	Trigonal (P321)
Rubidium aluminum silicate	$RbAlSiO_4$	Orthorhombic (Pcmm)
Rubidium aluminum silicate	$RbAlSi_2O_6$	Tetragonal (I4 <sub>1</sub> /a)
Rubidium aluminum sulfate	$RbAl(SO_4)_2$	Trigonal (P321)
Rubidium aluminum tetrafluoride	$RbAlF_4$	Tetragonal (P4/mmm)
Rubidium beryllium fluoride	$Rb_2BeF_4$	Orthorhombic (Pna2 <sub>1</sub> )
Rubidium bismuth molybdate	$RbBi(MoO_4)_2$	Monoclinic (P2 <sub>1</sub> /c)

# **Name, Formula, Crystal System, and Space Group for Optical Crystals—continued**

<b>Name</b>	<b>Formula</b>	<b>Crystal system (Space group)</b>
Rubidium bromide	RbBr	Cubic (Fm3m)

Sodium gadolinium silicate	NaGdSiO <sub>4</sub>	Orthorhombic (Pbn2 <sub>1</sub> )
Sodium gadolinium silicate	Na <sub>3</sub> GdSi <sub>3</sub> O <sub>9</sub>	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Sodium gadolinium silicate	Na <sub>5</sub> GdSi <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium gadolinium tetraphosphate	NaGdP <sub>4</sub> O <sub>12</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium gadolinium tungstate	NaGd(WO <sub>4</sub> ) <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /a)
Sodium gadolinium vanadate	Na <sub>3</sub> Gd(VO <sub>4</sub> ) <sub>2</sub>	Monoclinic (Cc)
Sodium gallium borate	Na <sub>2</sub> Ga <sub>2</sub> B <sub>2</sub> O <sub>7</sub>	Tetragonal

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Sodium gallium germanate	NaGaGeO <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium gallium germanate	NaGaGe <sub>2</sub> O <sub>6</sub>	Monoclinic (C2/c)
Sodium gallium silicate	NaGaSiO <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium germanate	Na <sub>2</sub> GeO <sub>3</sub>	Orthorhombic (Cmc2 <sub>1</sub> )
Sodium indate	NaInO <sub>2</sub>	Rhombohedral (R3/m)
Sodium indium germanate	Na <sub>5</sub> InGe <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium indium molybdate	NaIn(MoO <sub>4</sub> ) <sub>2</sub>	Triclinic (P-1)
Sodium indium silicate	Na <sub>5</sub> InSi <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium iodide	NaI	Cubic (Fm3m)
Sodium lanthanum arsenate	Na <sub>3</sub> La(AsO <sub>4</sub> ) <sub>2</sub>	Orthorhombic (Pbc2 <sub>1</sub> )
Sodium lanthanum borate	Na <sub>3</sub> La(BO <sub>3</sub> ) <sub>2</sub>	Monoclinic (P2 <sub>1</sub> /c)
Sodium lanthanum borate	Na <sub>3</sub> La <sub>2</sub> (BO <sub>3</sub> ) <sub>3</sub>	Orthorhombic (Amm2)
Sodium lanthanum borate	Na <sub>18</sub> La(BO <sub>3</sub> ) <sub>7</sub>	Monoclinic
Sodium lanthanum molybdate	NaLa(MoO <sub>4</sub> ) <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /a)
Sodium lanthanum oxide	NaLaO <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /amd)
Sodium lanthanum phosphate	Na <sub>3</sub> La(PO <sub>4</sub> ) <sub>2</sub>	Orthorhombic (Pbc2 <sub>1</sub> )
Sodium lanthanum pyrophosphate	NaLaP <sub>2</sub> O <sub>7</sub>	Orthorhombic
Sodium lanthanum tetrphosphate	NaLaP <sub>4</sub> O <sub>12</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium lanthanum tungstate	NaLa(WO <sub>4</sub> ) <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /a)
Sodium lanthanum vanadate	Na <sub>3</sub> La(VO <sub>4</sub> ) <sub>2</sub>	Orthorhombic (Pbc2 <sub>1</sub> )
Sodium lithium aluminum borosilicate (elbaite)	Na(Li,Al) <sub>3</sub> Al <sub>6</sub> (BO <sub>3</sub> ) <sub>3</sub> - Si <sub>6</sub> O <sub>18</sub> (OH)	Trigonal (R3m)
Sodium lithium aluminum fluoride	Na <sub>2</sub> LiAlF <sub>6</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium lithium aluminum fluorogarnet	Na <sub>3</sub> Li <sub>3</sub> Al <sub>2</sub> F <sub>12</sub>	Cubic (Ia3d)
Sodium lithium gallium fluorogarnet (GFG)	Na <sub>3</sub> Li <sub>3</sub> Ga <sub>2</sub> F <sub>12</sub>	Cubic (Ia3d)
Sodium lithium indium fluorogarnet	Na <sub>3</sub> Li <sub>3</sub> In <sub>2</sub> F <sub>12</sub>	Cubic (Ia3d)
Sodium lithium niobate	Na <sub>3</sub> Li <sub>2</sub> Nb <sub>5</sub> O <sub>15</sub>	Tetragonal (P4bm)
Sodium lithium scandium fluorogarnet	Na <sub>3</sub> Li <sub>3</sub> Sc <sub>2</sub> F <sub>12</sub>	Cubic (Ia3d)
Sodium lithium vanadate	NaLiV <sub>2</sub> O <sub>6</sub>	Monoclinic (C2/c)
Sodium lithium yttrium silicate	Na <sub>2</sub> LiYSi <sub>6</sub> O <sub>15</sub>	Orthorhombic (Cmca)
Sodium lithium zirconium silicate (Zektzerite)	Na <sub>2</sub> LiZrSi <sub>6</sub> O <sub>15</sub>	Orthorhombic (Cmca)
Sodium lutetium arsenate	Na <sub>3</sub> Lu(AsO <sub>4</sub> ) <sub>2</sub>	Monoclinic (Cc)
Sodium lutetium germanate	NaLuGeO <sub>4</sub>	Orthorhombic (Pbn2 <sub>1</sub> )
Sodium lutetium germanate	Na <sub>5</sub> LuGe <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium lutetium magnesium vanadate	Na <sub>2</sub> LuMg <sub>2</sub> V <sub>3</sub> O <sub>12</sub>	Cubic (Ia3d)
Sodium lutetium oxide	NaLuO <sub>2</sub>	Tetragonal(I4 <sub>1</sub> /amd)
Sodium lutetium phosphate	Na <sub>3</sub> Lu(PO <sub>4</sub> ) <sub>2</sub>	Monoclinic
Sodium lutetium pyrophosphate	NaLuP <sub>2</sub> O <sub>7</sub>	Monoclinic
Sodium lutetium silicate	NaLuSiO <sub>4</sub>	Orthorhombic (Pbcn)
Sodium lutetium silicate	Na <sub>5</sub> LuSi <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium lutetium vanadate	Na <sub>3</sub> Lu(VO <sub>4</sub> ) <sub>2</sub>	Monoclinic (P2 <sub>1</sub> /n)
Sodium magnesium aluminum fluoride (weberite)	NaMgAlF <sub>7</sub>	Orthorhombic (Imm2)
Sodium magnesium carbonate (eitelite)	Na <sub>2</sub> Mg(CO <sub>3</sub> ) <sub>2</sub>	Trigonal (R-3)

# **Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued***

<b>Name</b>	<b>Formula</b>	<b>Crystal system (Space group)</b>
Sodium magnesium fluoride (neighborite)	NaMgF <sub>3</sub>	Orthorhombic (Pcmm)

Sodium strontium phosphate	Na <sub>2</sub> Sr(PO <sub>2</sub> ) <sub>4</sub>	Tetragonal (P4/nbm)
Sodium tantalate	NaTaO <sub>3</sub>	Orthorhombic (Pbma)
Sodium titanium silicate (lorenzenite)	Na <sub>2</sub> Ti <sub>2</sub> Si <sub>2</sub> O <sub>9</sub>	Orthorhombic (Pnca)
Sodium titanium silicate (natisite)	Na <sub>2</sub> TiOSiO <sub>4</sub>	Tetragonal (P4/nmm)
Sodium vanadate	NaVO <sub>3</sub>	Monoclinic (C2/c)
Sodium yttrium fluoride	5NaF-9YF <sub>3</sub>	Cubic (Ia3d)
Sodium yttrium fluorosilicate	Na <sub>5</sub> Y <sub>4</sub> (SiO <sub>4</sub> ) <sub>4</sub> F	Rhombohedral (R-3)
Sodium yttrium germanate	NaYGeO <sub>4</sub>	Orthorhombic (Pbn2 <sub>1</sub> )
Sodium yttrium germanate	Na <sub>5</sub> YGe <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium yttrium magnesium vanadate	Na <sub>2</sub> YMg <sub>2</sub> V <sub>3</sub> O <sub>12</sub>	Cubic (Ia3d)
Sodium yttrium molybdate	NaY(MoO <sub>4</sub> ) <sub>2</sub>	Tetragonal (I4 <sub>1</sub> /a)
Sodium yttrium oxide	NaYO <sub>2</sub>	Monoclinic (P2 <sub>1</sub> /c)
Sodium yttrium silicate	NaYSiO <sub>4</sub>	Orthorhombic (Pbcn)
Sodium yttrium silicate	Na <sub>3</sub> YSi <sub>3</sub> O <sub>9</sub>	Orthorhombic (P2 <sub>1</sub> 2 <sub>1</sub> 2 <sub>1</sub> )
Sodium yttrium silicate	Na <sub>3</sub> YSi <sub>2</sub> O <sub>7</sub>	Hexagonal (P6 <sub>3</sub> /m)
Sodium yttrium silicate	Na <sub>5</sub> YSi <sub>4</sub> O <sub>12</sub>	Trigonal (R32)
Sodium yttrium tetrafluoride	NaYF <sub>4</sub>	Trigonal (P3 <sub>1</sub> )
Sodium zinc chloride	NaZnF <sub>3</sub>	Orthorhombic (Pnmc)
Sodium zinc fluoride	Na <sub>2</sub> ZnCl <sub>4</sub>	Orthorhombic (Pnma)
Strontium aluminate	SrAl <sub>2</sub> O <sub>4</sub>	Monoclinic (P2 <sub>1</sub> /n)
Strontium aluminate	SrAl <sub>4</sub> O <sub>7</sub>	Monoclinic (C2/c)
Strontium aluminate	Sr <sub>3</sub> Al <sub>2</sub> O <sub>6</sub>	Cubic (Pa3)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Strontium aluminum fluoride	$\text{SrAlF}_5$	Tetragonal (P4)
Strontium aluminum germanate	$\text{SrAl}_2\text{Ge}_2\text{O}_8$	Monoclinic (P2 <sub>1</sub> /a)
Strontium aluminum silicate	$\text{SrAl}_2\text{Si}_2\text{O}_8$	Monoclinic (P2 <sub>1</sub> /a)
Strontium aluminum silicate	$\text{Sr}_2\text{Al}_2\text{SiO}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium barium niobate (SBN)	$\text{Sr}_{0.6}\text{Ba}_{0.4}\text{Nb}_2\text{O}_6$	Tetragonal
Strontium borate	$\text{SrB}_2\text{O}_4$	Orthorhombic (Pnca)
Strontium borate	$\text{SrB}_4\text{O}_7$	Orthorhombic (Pbca)
Strontium borate	$\text{Sr}_3\text{B}_2\text{O}_6$	Rhombohedral (R-3c)
Strontium bromovanadate	$\text{Sr}_2\text{VO}_4\text{Br}$	Orthorhombic (Pbcm)
Strontium carbonate (strontianite)	$\text{SrCO}_3$	Orthorhombic (Pnam)
Strontium chloroarsenate	$\text{Sr}_2\text{AsO}_4\text{Cl}$	Orthorhombic (Pbcm)
Strontium chloroarsenate	$\text{Sr}_5(\text{AsO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium chloroborate	$\text{Sr}_2\text{B}_5\text{O}_9\text{Cl}$	Tetragonal (P4 <sub>2</sub> 2 <sub>1</sub> 2)
Strontium chlorophosphate	$\text{Sr}_5(\text{PO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium chlorovanadate	$\text{Sr}_2\text{VO}_4\text{Cl}$	Orthorhombic (Pbcm)
Strontium chlorovanadate	$\text{Sr}_5(\text{VO}_4)_3\text{Cl}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium fluoride	$\text{SrF}_2$	Cubic (Fm3m)
Strontium fluoroarsenate	$\text{Sr}_5(\text{AsO}_4)_3\text{F}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium fluorophosphate (SFAP)	$\text{Sr}_5(\text{PO}_4)_3\text{F}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium fluorovanadate (SVAP)	$\text{Sr}_5(\text{VO}_4)_3\text{F}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium gadolinium aluminate	$\text{SrGdAlO}_4$	Tetragonal (I4/mmm)
Strontium gadolinium gallate (SGGM)	$\text{SrGdGa}_3\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium gadolinium phosphate	$\text{Sr}_3\text{Gd}(\text{PO}_4)_3$	Cubic (I-43d)
Strontium gadolinum oxide	$\text{SrGd}_2\text{O}_4$	Orthorhombic (Pnma)
Strontium gallate	$\text{SrGa}_2\text{O}_4$	Monoclinic (P2 <sub>1</sub> /n)
Strontium gallium fluoride	$\text{SrGaF}_5$	Tetragonal (P4)
Strontium gallium germanate	$\text{Sr}_3\text{Ga}_2\text{Ge}_4\text{O}_{14}$	Trigonal (P32 <sub>1</sub> )
Strontium gallium silicate	$\text{SrGa}_2\text{Si}_2\text{O}_8$	Monoclinic (P2 <sub>1</sub> /a)
Strontium gallium silicate	$\text{Sr}_2\text{Ga}_2\text{SiO}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium hexa-aluminate	$\text{SrAl}_{12}\text{O}_{19}$	Hexagonal (P6 <sub>3</sub> /mmc)
Strontium indium germanium garnet	$\text{Sr}_3\text{In}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Strontium indium oxide	$\text{SrIn}_2\text{O}_4$	Orthorhombic (Pnma)
Strontium lanthanum aluminate	$\text{SrLaAlO}_4$	Tetragonal (I4/mmm)
Strontium lanthanum borate	$\text{SrLaBO}_4$	Hexagonal (P6 <sub>3</sub> 22)
Strontium lanthanum gallate	$\text{SrLaGaO}_4$	Tetragonal (I4/mmm)
Strontium lanthanum oxysilicate	$\text{SrLa}_4(\text{SiO}_4)_3\text{O}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium lanthanum phosphate	$\text{Sr}_3\text{La}(\text{PO}_4)_3$	Cubic (I-43d)
Strontium lutetium oxide	$\text{SrLu}_2\text{O}_4$	Orthorhombic (Pnma)
Strontium magnesium germanate	$\text{Sr}_2\text{MgGe}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium magnesium silicate	$\text{Sr}_2\text{MgSi}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium magnesium vanadate	$\text{SrMg}_2(\text{VO}_4)_2$	Tetragonal (I4 <sub>1</sub> /acd)
Strontium molybdate	$\text{SrMoO}_4$	Tetragonal (I4 <sub>1</sub> /a)
Strontium niobate	$\text{SrNb}_2\text{O}_6$	Orthorhombic (Pcan)

## Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued*

Name	Formula	Crystal system (Space group)
Strontium niobate	$\text{Sr}_2\text{Nb}_2\text{O}_7$	Orthorhombic (Cmc2 <sub>1</sub> )
Strontium niobate	$\text{Sr}_5\text{Nb}_4\text{O}_{15}$	Monoclinic (P2 <sub>1</sub> /m)
Strontium niobate	$\text{SrNb}_2\text{O}_6$	Monoclinic (P2 <sub>1</sub> /c)
Strontium potassium niobate	$\text{Sr}_2\text{KNb}_5\text{O}_{15}$	Orthorhombic (Im2a)
Strontium potassium tantalate	$\text{Sr}_2\text{KTa}_5\text{O}_{15}$	Orthorhombic (Im2a)
Strontium scandate	$\text{SrSc}_2\text{O}_4$	Orthorhombic (Pnam)
Strontium scandium germanium garnet	$\text{Sr}_3\text{Sc}_2\text{Ge}_3\text{O}_{12}$	Cubic (Ia3d)
Strontium silicate	$\text{SrSiO}_3$	Monoclinic (C2)
Strontium sodium niobate	$\text{Sr}_2\text{NaNb}_5\text{O}_{15}$	Orthorhombic (Im2a)
Strontium sulfate (celestite)	$\text{SrSO}_4$	Orthorhombic (Pmma)
Strontium tantalate	$\text{Sr}_2\text{Ta}_2\text{O}_7$	Orthorhombic (Pnma)
Strontium tin borate	$\text{SrSnB}_2\text{O}_6$	Trigonal (R-3)
Strontium tin oxide	$\text{SrSnO}_3$	Cubic (P2 <sub>1</sub> 3)
Strontium titanate	$\text{Sr}_3\text{Ti}_2\text{O}_7$	Tetragonal (I4/mmm)
Strontium titanate (tausonite)	$\text{SrTiO}_3$	Cubic (Pm3m)
Strontium titanium borate	$\text{SrTiB}_2\text{O}_6$	Trigonal (R-3)
Strontium tungstate	$\text{SrWO}_4$	Tetragonal (I4 <sub>1</sub> /a)
Strontium vanadate	$\text{SrV}_2\text{O}_6$	Monoclinic (C2/m)
Strontium vanadate	$\beta\text{-Sr}_2\text{V}_2\text{O}_7$	Tetragonal (I4 <sub>1</sub> /amd)
Strontium vanadate	$\text{Sr}_3(\text{VO}_4)_2$	Rhombohedral (R-3m)
Strontium vanadate	$\beta\text{-Sr}_2\text{V}_2\text{O}_7$	Tetragonal (P4 <sub>1</sub> )
Strontium vanadate	$\text{SrVO}_3$	Cubic (Pm3m)
Strontium yttrium borate	$\text{Sr}_3\text{Y}(\text{BO}_3)_3$	Trigonal (R-3)
Strontium yttrium oxide	$\text{SrY}_2\text{O}_4$	Orthorhombic (Pnma)
Strontium yttrium oxysilicate	$\text{SrY}_4(\text{SiO}_4)_3\text{O}$	Hexagonal (P6 <sub>3</sub> /m)
Strontium zinc fluoride	$\text{SrZnF}_4$	Tetragonal (I4 <sub>1</sub> /a)
Strontium zinc germanate	$\text{SrZnGe}_2\text{O}_6$	Monoclinic (C2/c)
Strontium zinc germanate	$\text{Sr}_2\text{ZnGe}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium zinc silicate	$\text{Sr}_2\text{ZnSi}_2\text{O}_7$	Tetragonal (P42 <sub>1</sub> m)
Strontium zirconate	$\text{SrZrO}_3$	Orthorhombic (Pnma)
Strontium zirconium borate	$\text{SrZrB}_2\text{O}_6$	Trigonal (R-3)
Strontium tantalate	$\text{SrTa}_2\text{O}_6$	Orthorhombic (Pcan)
Strontium tantalate	$\text{Sr}_2\text{Ta}_2\text{O}_7$	Orthorhombic (Cmcm)
Strontium tantalate	$\text{Sr}_5\text{Ta}_4\text{O}_{15}$	Hexagonal
Strontium tantalate	$\text{Sr}_6\text{Ta}_2\text{O}_{11}$	Cubic
Tantalum borate (behierite)	$\text{TaBO}_4$	Tetragonal (I4 <sub>1</sub> /amd)
Tantalum oxide (tantite)	$\text{Ta}_2\text{O}_5$	Orthorhombic (P2mm)
Tantalum oxyphosphate	$\text{TaOPO}_4$	Tetragonal (P4/n)
Tellurium	Te	Trigonal (32)
Tellurium oxide (tellurite)	$\text{TeO}_2$	Orthorhombic (Pbca)
Thallium aluminum selenate	$\text{TlAl}(\text{SeO}_4)_2$	Trigonal (P321)
Thallium aluminum sulfate	$\text{TlAl}(\text{SO}_4)_2$	Trigonal (P321)
Thallium aluminum tetrafluoride	$\text{TlAlF}_4$	Tetragonal (P4/mmm)

# **Name, Formula, Crystal System, and Space Group for Optical Crystals—continued**

<b>Name</b>	<b>Formula</b>	<b>Crystal system (Space group)</b>
Thallium arsenic selenide	$\text{Tl}_3\text{AsSe}_3$	Trigonal (R3c)
Thallium arsenic sulfide (ellisite)	$\text{Tl}_3\text{AsS}_3$	Trigonal (R3c)
Thallium bromide	$\text{TlBr}$	Cubic (Fm3m)
Thallium bromiodide (KRS-5)	$\text{Tl}(\text{Br},\text{I})$	Cubic (Fm3m)
Thallium chloride	$\text{TlCl}$	Cubic (Fm3m)
Thallium chlorobromide (KRS-6)	$\text{Tl}(\text{Cl},\text{Br})$	Cubic (Fm3m)
Thallium gallium selenate	$\text{TlGa}(\text{SeO}_4)_2$	Trigonal (P321)
Thallium gallium sulfate	$\text{TlGa}(\text{SO}_4)_2$	Trigonal (P321)
Thallium niobium borate	$\text{TlNbB}_2\text{O}_6$	Orthorhombic (Pn2 <sub>1</sub> m)
Thallium oxide (avicennite)	$\text{Tl}_2\text{O}_3$	Cubic (Ia3d)
Thallium tantalum borate	$\text{TlTaB}_2\text{O}_6$	Orthorhombic (Pn2 <sub>1</sub> m)

Yttrium iron garnet (YAG)	$\text{Y}_3\text{Fe}_5\text{O}_{12}$	Cubic ( $\text{Ia3d}$ )
yttrium lithium fluoride (YLF)	$\text{LiYF}_4$	Tetragonal ( $\text{I4}_1/\text{a}$ )
Yttrium magnesium beryllium silicate (gadolinite)	$\text{Y}_2\text{MgBe}_2\text{Si}_2\text{O}_{10}$	Monoclinic ( $\text{P2}_1/\text{c}$ )
Yttrium molybdate	$\text{Y}_2(\text{MoO}_4)_3$	Orthorhombic ( $\text{Pbcn}$ )
Yttrium niobate (fergusonite)	$\text{YNbO}_4$	Monoclinic ( $\text{C2}/\text{c}$ )
Yttrium orthosilicate (YOS, YSO)	$\text{Y}_2\text{SiO}_5$	Monoclinic ( $\text{C2}/\text{c}$ )
Yttrium oxide (yttria)	$\text{Y}_2\text{O}_3$	Cubic ( $\text{Ia3}$ )
Yttrium oxychloride	$\text{YOC1}$	Rhombohedral ( $\text{R}-3\text{m}$ )
Yttrium molybdate	$\text{Y}_2\text{Mo}_2\text{O}_7$	Cubic ( $\text{Fd3m}$ )
Yttrium oxymolybdate	$\text{Y}_2\text{MoO}_6$	Monoclinic ( $\text{I2}/\text{c}$ )
Yttrium oxysulfate	$\text{Y}_2\text{OS}_2$	Monoclinic ( $\text{P2}_1/\text{c}$ )
Yttrium oxytungstate	$\text{Y}_2\text{WO}_6$	Monoclinic ( $\text{P2}/\text{c}$ )
Yttrium pentaphosphate	$\text{YP}_5\text{O}_{14}$	Orthorhombic ( $\text{Pcmn}$ )
Yttrium phosphate (xenotime)	$\text{YPO}_4$	Tetragonal ( $\text{I4}_1/\text{amd}$ )
Yttrium scandate	$\text{YScO}_3$	Orthorhombic ( $\text{Pbnm}$ )
Yttrium scandium aluminum garnet (YSAG)	$\text{Y}_3\text{Sc}_2\text{Al}_3\text{O}_{12}$	Cubic ( $\text{Ia3d}$ )
Yttrium scandium gallium garnet (YSGG)	$\text{Y}_3\text{Sc}_2\text{Ga}_3\text{O}_{12}$	Cubic ( $\text{Ia3d}$ )
Yttrium silicate (keiviite)	$\text{Y}_2\text{Si}_2\text{O}_7$	Monoclinic ( $\text{C2}/\text{m}$ )
Yttrium silicon beryllate	$\text{Y}_2\text{SiBe}_2\text{O}_7$	Tetragonal ( $\text{P42}_1\text{m}$ )
Yttrium tantalate	$\text{Y}_3\text{TaO}_7$	Orthorhombic ( $\text{C222}_1$ )
Yttrium tantalate (formanite)	$\text{YTao}_4$	Monoclinic ( $\text{P2}/\text{a}$ )
Yttrium titanate	$\text{Y}_2\text{Ti}_2\text{O}_7$	Cubic ( $\text{Fd3m}$ )
Yttrium titanium silicate (trimounsine)	$\text{Y}_2\text{Ti}_2\text{SiO}_9$	Monoclinic
Yttrium titanium tantalate	$\text{YTiTaO}_6$	Orthorhombic ( $\text{Pbcn}$ )
Yttrium tungstate	$\text{Y}_2(\text{WO}_4)_3$	Orthorhombic ( $\text{Pcna}$ )
Yttrium vanadate (wakefieldite)	$\text{YVO}_4$	Tetragonal ( $\text{I4}_1/\text{amd}$ )
Yttrium zinc beryllium silicate	$\text{Y}_2\text{ZnBe}_2\text{Si}_2\text{O}_{10}$	Monoclinic ( $\text{P2}_1/\text{c}$ )
Zinc aluminate (gahnite)	$\text{ZnAl}_2\text{O}_4$	Cubic ( $\text{Fd3m}$ )
Zinc antimonate (ordonezite)	$\text{ZnSb}_2\text{O}_6$	Tetragonal ( $\text{P4}_2/\text{mnm}$ )
Zinc arsenate	$\text{ZnAsO}_4$	Monoclinic ( $\text{P2}_1/\text{c}$ )
Zinc arsenide (reinerite)	$\text{Zn}_3(\text{AsO}_3)_2$	Orthorhombic ( $\text{Pbam}$ )
Zinc borate	$\text{Zn}_3(\text{BO}_3)_2$	Monoclinic ( $\text{P2}/\text{c}$ )
Zinc borate	$\text{ZnB}_4\text{O}_7$	Othorhombic ( $\text{Pbca}$ )
Zinc borate	$\text{Zn}_4\text{B}_6\text{O}_{13}$	Cubic ( $\text{I}-43\text{m}$ )
Zinc carbonate (smithsonite)	$\text{ZnCO}_3$	Rhombohedral ( $\text{R}-3\text{c}$ )
Zinc chloride	$\text{ZnCl}_2$	Tetragonal ( $\text{P4}_2/\text{mnm}$ )
Zinc fluoride	$\text{ZnF}_2$	Tetragonal ( $\text{P4}_2/\text{mnm}$ )
Zinc gallate	$\text{ZnGa}_2\text{O}_4$	Cubic ( $\text{Fd3m}$ )
Zinc germanate	$\text{Zn}_2\text{GeO}_4$	Tetragonal ( $\text{I4}_122$ )
Zinc germanium arsenide	$\text{ZnGeAs}_2$	Tetragonal ( $\text{I}-42\text{d}$ )
Zinc germanium phosphide	$\text{ZnGeP}_2$	Tetragonal ( $\text{I}-42\text{d}$ )

**Name, Formula, Crystal System, and Space Group for Optical Crystals—*continued***

<b>Name</b>	<b>Formula</b>	<b>Crystal system (Space group)</b>
Zinc oxide (zincite)	ZnO	Hexagonal (6mm)
Zinc pyroarsenate	Zn <sub>2</sub> As <sub>2</sub> O <sub>7</sub>	Monoclinic (C2/m)
Zinc selenide (stilleite, Irtran 4)	ZnSe	Cubic (Fm3m)
Zinc silicate (willemite)	Zn <sub>2</sub> SiO <sub>4</sub>	Trigonal (R-3)
Zinc silicon arsenide	ZnSiAs <sub>2</sub>	Tetragonal (I-42d)
Zinc silicon phosphide	ZnSiP <sub>2</sub>	Tetragonal (I-42d)
Zinc sulfide (sphalerite, Irtran 2, zincblende)	β-ZnS	Cubic (Fm3m)
Zinc sulfide (wurtzite)	α-ZnS	Hexagonal (P6mm)
Zinc telluride	ZnTe	Cubic (Fm3m)
Zinc tin antimonide	ZnSnSb <sub>2</sub>	Tetragonal (I-42d)
Zinc tin arsenide	ZnSnAs <sub>2</sub>	Tetragonal (I-42d)
Zinc tin phosphide	ZnSnP <sub>2</sub>	Tetragonal (I-42d)
Zinc tungstate	ZnWO <sub>4</sub>	Monoclinic (P2/c)
Zinc vanadate	ZnV <sub>2</sub> O <sub>6</sub>	Monoclinic (C2)
Zinc silicon arsenate	ZnSiAs <sub>2</sub>	Cubic (F-43m)
Zirconium oxide	ZrO <sub>2</sub>	Tetragonal (P4 <sub>2</sub> /nmc)
Zirconium oxide (cubic zirconia, CZ)	ZrO <sub>2</sub> :0.12Y <sub>2</sub> O <sub>3</sub>	Cubic (Fm3m)
Zirconium silicate (zircon)	ZrSiO <sub>4</sub>	Tetragonal (I4 <sub>1</sub> /amd)

## 1.2 Physical Properties\*

Physical properties of optical crystals in this section are grouped into three tables: isotropic crystals, uniaxial crystals, and biaxial crystals. Materials are listed alphabetically in order of the chemical formulas. The following properties are included:

*Density:* Data are for room temperature.

*Hardness:* This is an empirical and relative measure of a material's resistance to wear. Average Knoop (indentation test) hardness numbers or range of values at room temperature are given when available. In many cases only Vicker (V) or Mohs hardness are known. This is indicated parentheses after the value. The hardness of a crystal varies with orientation even for cubic symmetry crystals.

*Cleavage:* The ease of cleavage varies greatly depending on the crystal quality and the nature and direction of stress applied. In many crystals there can be more than one set of cleavage planes. Miller indices are used to denote the cleavage planes. The actual number of cleavage planes depends on the plane orientation relative to the symmetry of the crystal. Only the easiest cleavage plane for each crystal is listed. They are ranked qualitatively as perfect (p) or imperfect (i). A crystal listed with a perfect cleavage plane can crack along that direction with a smooth surface if a stress is applied. The imperfect cleavage plane means that the crack does not easily move along the plane, although a small area of oriented flat surfaces may form along the cracking surface when the crystal is fractured.

*Solubility:* Solubility is defined as the weight loss in grams per 100 grams of water. The dissolution temperature in °C is included in parentheses, if given. If the solubility is less than  $10^{-3}$  g/100 g, the material is generally considered to be insoluble. If a crystal is listed as insoluble, it means that, when submerged in water with a reasonable amount of time (a day or so), no noticeable loss of weight nor visible surface erosion of the crystal is observed.

\* This section was adapted from "Optical Crystals" by B. H. T. Chai, *Handbook of Laser Science and Technology, Suppl. 2, Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 30 ff (with additions).

### 1.2.1 Isotropic Crystals

**Physical Properties of Isotropic Crystalline Materials**

Cubic material	Density (g/cm <sup>3</sup> )	Hardness (kg/mm <sup>2</sup> )	Cleavage plane	Solubility (°C) (g/100 g H <sub>2</sub> O)
AgBr	6.473	7	None	$1.2 \times 10^{-5}$ (20)
AgCl	5.56	9.5	None	$1.5 \times 10^{-4}$ (20)
AlAs	3.729	—	(111)-p	Insoluble
Al <sub>23</sub> O <sub>27</sub> N <sub>5</sub> (ALON)	3.713	1850	—	Insoluble
AIP	2.40	—	—	Slightly soluble
AlSb	4.26	—	—	
As <sub>2</sub> O <sub>3</sub>	3.87	1.5 (Mohs)	(111)	Soluble
Ba(NO <sub>3</sub> ) <sub>2</sub>	3.24	—	None	Soluble
Ba <sub>2</sub> Zr <sub>2</sub> Si <sub>3</sub> O <sub>12</sub>	—	—	—	Insoluble
Ba <sub>3</sub> Al <sub>2</sub> O <sub>6</sub>	5.008	—	—	—

**Physical Properties of Isotropic Crystalline Materials—continued**

<b>Cubic material</b>	<b>Density (g/cm<sup>3</sup>)</b>	<b>Hardness (kg/mm<sup>2</sup>)</b>	<b>Cleavage plane</b>	<b>Solubility (°C) (g/100 g H<sub>2</sub>O)</b>
Ba <sub>3</sub> MgTa <sub>2</sub> O <sub>9</sub>	6.435	—	—	Insoluble

## 1.3 Optical Properties\*

The optical properties of crystals in this section are grouped into three tables: isotropic crystals, uniaxial crystals, and biaxial crystals. Materials are listed alphabetically in order of the chemical formulas. The following properties are included:

*Transmission Range:* Electronic and lattice absorption edges are given in terms of the wavelengths between which the transmission of a 1-mm-thick sample at 300 K is  $\geq 10\%$ . The values cited are approximate and are intended to as a general guide because many factors such as impurities, imperfections, temperature, crystallographic orientations, and compositional variations can affect the values.

*Band Gap:* Band gap data for transitions at room temperature unless noted otherwise. The energy gap depends on the structure of the material and varies with direction in anisotropic crystals. Optical transition: (D) – direct, (I) – indirect.

*Refraction Index (n):* For isotropic crystals, there is only one refractive index. Uniaxial crystals with tetragonal, hexagonal, and trigonal (or rhombohedral) symmetry exhibit a unique index of refraction (symbolized as  $e$  or  $\epsilon$ ) when light vibrates parallel to the  $c$ -axis (the extraordinary ray). For light vibrating at  $90^\circ$  to the  $c$ -axis (the ordinary ray), the refractive indices are the same (symbolized as  $o$  or  $\omega$ ) in all  $360^\circ$  directions. Biaxial crystals with orthorhombic, monoclinic, and triclinic symmetry possess three significant indices of refraction, commonly symbolized as  $x$ ,  $y$ ,  $z$  or  $\alpha$ ,  $\beta$ ,  $\gamma$  in the order from smallest to largest.

Unless specified, the refraction indices are the average values for standard daylight or are the values measured at 632.8 nm at room temperature (the differences in the daylight and He-Ne values are within 0.1%). In a few instances, e.g., tellurides, these materials are opaque to visible light so that the refractive indices are measured with an infrared light source. In these cases, the wavelength used is listed with parentheses.

*Birefringence ( $\Delta n$ ):* Birefringence of anisotropic materials is a measure of the maximum difference of the refractive indices within a crystal for a given wavelength.

*Dispersion formulas:* Refractive indices at specific wavelengths within specified ranges can be derived from dispersion formulas given in Section 1.3.4. Note that several different functional forms have been used to represent the dispersion of the refractive index.

*Thermo-optic coefficients ( $dn/dt$ ):* Thermo-optic coefficients of optical crystals at various wavelengths are given in Section 1.3.5.

---

**1.3.4 Dispersion Formulas for Refractive Indices**

Dispersion formulas for the refractive indices of crystals at room temperature are given in the following pages. Tabulated values of refractive indices at many wavelengths are given in Refs. 1–4 for most of the crystals below. Dispersion formulas for several organic materials are given in Refs. 1 and 3.

### Dispersion Formulas for Refractive Indices

Material	Dispersion formula (wavelength $\lambda$ in $\mu\text{m}$ )	Range ( $\mu\text{m}$ )	Ref.
Ag <sub>3</sub> AsS <sub>3</sub>	$n_o^2 = 7.483 + 0.474/(\lambda^2 - 0.09) - 0.0019\lambda^2$	0.63–4.6	5

## 1.4 Mechanical Properties

### 1.4.1 Elastic Constants

The following tables are from the *CRC Handbook of Chemistry and Physics*, 82nd edition, Lide, D. R., Ed. (CRC Press, Boca Raton, FL, 2001), p. 12–37, with additions from the *Handbook of Optics*, Vol. 2 (McGraw–Hill, New York, 1999) and the *Handbook of Laser Science and Technology*, Vol. IV and Suppl. (CRC Press, Boca Raton, FL, 1995).

The elastic constants  $C_{ij}$  for single crystals are given in units of  $10^{11}$  N/m<sup>2</sup> (equivalent to 100 GPa or  $10^{12}$  dyn/cm<sup>2</sup>). The values are for room temperature.

A useful compilation of published values from various sources may be found in Simmons, G., and Wang, H., *Single Crystal Elastic Constants and Calculated Aggregate Properties: A Handbook*, 2nd edition, (The MIT Press, Cambridge, MA, 1971). Temperature and pressure coefficients of the elastic constants for many materials are included in *Landolt–Börnstein, New Series*, III/11, Hellwege, K.–H. and Hellwege, A. M., Eds. (Springer–Verlag, New York, 1979).

## 1.4.2 Elastic Moduli

The mechanical response of a material to an applied force is described by various moduli. Young's modulus  $E$  (extension in tension) and the modulus of rigidity or shear  $G$  are related to Poisson's ratio  $\mu$  (ratio of lateral to longitudinal strain under unilateral stress) by  $\mu = E/2G - 1$ . The bulk modulus  $B$  (1/isothermal compressibility) is related to the above moduli by  $B = E/3(1 - \mu)$ .

Elastic Moduli				
Material	Poisson's ratio	Moduli		
		Young's $E$ (GPa)	Rigidity $G$ (GPa)	Bulk $B$ (GPa)

### 1.4.3 Engineering Data

The following engineering properties can depend on the production method and exhibit sample-to-sample variations. Material strength may also depend on subsurface damage resulting from grinding and polishing. Therefore, the data should be considered only as a guide.

Engineering Data				
Material	Flexure strength (MPa)	Fracture toughness (MPa m <sup>1/2</sup> )	Volume compressibility (Tpa <sup>-1</sup> )	Ref.
AgCl	26			1

1.5 Thermal Properties

1.5.1 Melting Point, Heat Capacity, Thermal Expansion, and Thermal Conductivity

Values for the heat capacity and the thermal expansion coefficient are those at or near room temperature; thermal conductivity values are for the temperatures T indicated.

Thermal Properties

1.6.3 Ferromagnetic, Antiferromagnetic, and Ferrimagnetic Materials

The following symbols are used in the tables below:

$T_c$ = Curie temperature	$4\pi M_S$ = saturation induction at 0 K, gauss
$T_p$ = phase transition temperature	F = specific Faraday rotation, deg/cm
$T_N$ = Neel temperature	$\alpha$ = absorption coefficient ( $\text{cm}^{-1}$ )
$T_\infty$ = compensation temperature	$\lambda$ = measurement wavelength, nm

Transition Metals*						
Material (structure)	Critical temp.	$4\pi M_S$ (gauss)	F (deg/cm)	Absorp. coeff. $\alpha$ ( $\text{cm}^{-1}$ )	Temp. (K)	$\lambda$ (nm)
Fe (bcc)	$T_c = 1043$	21800	$4.4 \times 10^5$	$6.5 \times 10^5$	300	500
			$3.5 \times 10^5$	$7.6 \times 10^5$	300	546
			$6.5 \times 10^5$	$5 \times 10^5$	300	1000

1.7 Electrooptic Properties

1.7.1 Linear Electrooptic Coefficients

The linear electrooptic effect occurs in acentric crystals. Only 21 acentric groups (those lacking a center of inversion) may have nonvanishing coefficients. Reduced electrooptic matrix forms are given in the two references below.

If the electrooptic coefficient  $r_{ij}$  is determined at constant strain (by making the measurement at high frequencies well above acoustic resonances of the sample) the crystal is clamped, as indicated by S. If the  $r_{ij}$  is determined at constant stress (at low frequencies well below the acoustic resonances of the sample) the sample is free, as indicated by T. The electrooptic coefficients are generally those for room temperature. Typical accuracies for  $r_{ij}$  are  $\pm 15\%$ . Unless shown explicitly, the signs of  $r_{ij}$  have not been determined. As a rule,  $r_{ij}$  has little optical wavelength dependence in the transparent region of the crystal.

The following tables were adapted from:

Kaminow, I. P., Linear Electrooptic Materials, *Handbook of Laser Science and Technology*, Vol. IV (CRC Press, Boca Raton, FL, 1986), p. 253.

Holland, W. R. and Kaminow, I. P., Linear Electrooptic Materials, *Handbook of Laser Science and Technology, Suppl. 2* (CRC Press, Boca Raton, FL, 1995), p. 133.

A comprehensive table of electrooptic constants including extensive data on refractive indices and curves of wavelength and temperature dependence of electrooptic coefficients is given in Cook, W. R., Hearmon, R. F. S., Jaffe, H., and Nelson, D. F., Piezooptic and electrooptic coefficient constants, *Landolt-Börnstein*, Group III, Vol. 11, Hellewege, K.-H. and Hellewege, A. M., Eds. (Springer-Verlag, New York, 1979), p. 495.

The following tables are divided according to the general structure of the electrooptic materials, i.e., tetrahedrally coordinated binary AB compounds that are semiconductors, ABO<sub>3</sub>-type compounds that are ferroelectric or pyroelectric, isomorphs of ferroelectric KH<sub>2</sub>PO<sub>4</sub> and antiferroelectric NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub>, other compounds that do not fit the previous categories, and organic compounds. Although nonlinear optic coefficients have been measured for many organic crystal and can be converted to equivalent electrooptic coefficients, only direct phase retardation measurements of the electrooptic effect are included in the last table.

AB-Type Compounds				
Material	Symmetry	T/S	Electrooptic coeff.*	Wavelength
			$r_{ij}$ ( $10^{-12}$ m/V)	$\lambda$ ( $\mu m$ )

## 1.8 Elastooptic Properties

### 1.8.1 Elastooptic Coefficients

The following tables of elastooptic coefficients (photoelastic constants) are from the *CRC Handbook of Chemistry and Physics*, 82nd edition, Lide, D. R., Ed. (CRC Press, Boca Raton, FL, 2001), p. 12–180. Materials are listed alphabetically by chemical composition. Data have been measured at room temperature, except for rare gas crystals.

### 1.8.2 Acoustooptic Materials

A figure of merit for an acoustooptic material is  $M = n^6 p^2 / \rho v^3$ , where  $n$  is the refractive index,  $p$  is the photoelastic constant,  $\rho$  is the density, and  $v$  is the sound velocity.

Properties of Selected Acoustooptic Materials				
Material	Transparency range (μm)	Acoustic mode/direction	Acoustic velocity (km/s)	Figure of merit
Ge	2–20	L <111>	5.5	840
Hg <sub>2</sub> Br <sub>2</sub>	0.40–30	S <110>	0.273	2600
Hg <sub>2</sub> Cl <sub>2</sub>	0.36–20	S <110>	0.347	700
Hg <sub>2</sub> I <sub>2</sub>	0.45–40	S <110>	0.254	3200
LiNbO <sub>3</sub>	0.35–5.0	L <100>	6.5	4.6
PbBr <sub>2</sub>	0.36–60	S <010>	2.30	550
PbCl <sub>2</sub>	0.35–20	S <001>	2.51	136
PbMoO <sub>4</sub>	0.42–5.5	L <001>	3.63	36.3
SiO <sub>2</sub>	0.12–4.5	L <100>	5.72	2.38
TeO <sub>2</sub>	0.35–5.0	L <001>	4.2	34.5
		S <110>	0.62	793
Tl <sub>3</sub> AsS <sub>3</sub>	1.3–17	L <001>	2.15	416

All measurements at 0.633 μm, except for Ge at 10.6 μm; L = longitudinal, S = shear.

## 1.9 Nonlinear Optical Properties

### 1.9.1 Nonlinear Refractive Index\*

Nonlinear refraction is commonly defined either in terms of the optical field intensity  $I$

$$n = n_0 + \gamma I$$

or in terms of the average of the square of the optical electric field  $\langle E^2 \rangle$

$$n = n_0 + n_2 \langle E^2 \rangle,$$

where  $n_0$  is the ordinary linear refractive index,  $\gamma$  is the nonlinear refractive coefficient, and  $n_2$  is the nonlinear refractive index. The conversion between  $n_2$  and  $\gamma$  is given by

$$n_2 [\text{cm}^3/\text{erg}] = (cn_0/40\pi) \gamma [\text{m}^2/\text{W}] = 238.7 n_0 \gamma [\text{cm}^2/\text{W}],$$

where  $c$  is the speed (in m/s) of light in vacuum.

In terms of third-order susceptibility tensor  $\chi^{(3)}(-\omega, \omega, \omega, -\omega)$  of the medium, the nonlinear refractive indices for a linearly polarized wave and a circularly polarized wave in an isotropic material are

$$n_2(\text{LP}) = (12\pi/n_0) \chi_{1111}^{(3)}(-\omega, \omega, \omega, -\omega)$$

and

$$n_2(\text{CP}) = (24\pi/n_0) \chi_{1122}^{(3)}(-\omega, \omega, \omega, -\omega).$$

Whereas in a cubic material the linear refractive index is isotropic,  $n_2$  is not. If  $\theta$  is the angle made by the electric field vector with the  $[100]$  axis for a wave propagating along, say,  $[001]$ , the effective value of  $\chi^{(3)}$  is given by

$$n_2(\theta) = 12\pi/n_0 \{ \chi_{1111}^{(3)} [1 + \sigma \sin^2(\theta)/2] \},$$

where

$$\sigma = [\chi_{1111}^{(3)} - \chi_{1122}^{(3)} + 2\chi_{1212}^{(3)}] / \chi_{1111}^{(3)}.$$

For a circularly polarized beam propagating along  $[100]$

$$n_2(\text{CP}, 100) = 6\pi/n_0 [\chi_{1111}^{(3)} + 2\chi_{1122}^{(3)} - \chi_{1212}^{(3)}]$$

and for a circularly polarized beam propagating along  $[111]$

$$n_2(\text{CP}, 111) = 4\pi/n_0 [\chi_{1111}^{(3)} + 4\chi_{1122}^{(3)} - \chi_{1212}^{(3)}].$$

The nonlinear refractive index is not a unique quantity for a given material because several physical mechanisms contribute to the polarization that is cubic in the applied optical elect-

---

\* This section was adapted from Chase, L. L. and Van Stryland, E. W., Nonlinear Refractive index: inorganic materials, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 269.

ric field. These physical mechanisms require a material response that can take place on various time scales. The mechanisms that contribute most strongly to  $n_2$ , and their characteristic time scales (in parentheses) are bound electrons ( $10^{-15}$  s), optically created free carriers ( $>10^{-12}$  s), Raman-active optical phonons ( $10^{-12}$  s), electrostriction ( $>10^{-9}$  s), and thermal excitation ( $\sim 10^{-9}$  s).

Several methods listed below have been employed to measure  $n_2$ . The details of the measurements determine the relative contributions from the various possible physical mechanisms to the measured  $n_2$ . In general, experiments done with picosecond pulses and nondegenerate mixing are less likely to be affected by the “slow” electrostrictive or thermal effects than those done in the nanosecond pulse regime and with degenerate mixing. Most of the measurements include the effects of both electronic and vibrational (Raman) contributions to  $n_2$ .

WFC	Wavefront conjugation	21
ZS	Z-scan	22

In the following tables of nonlinear refractive parameters, values in parentheses were calculated by Chase and Van Stryland<sup>1</sup> from the quantities reported in the original references. Refractive indices in parentheses were obtained from extrapolation of available data. For noncubic crystals, or for cubic crystals where the polarization is not along a cube axis or is not specified in the original reference, the value tabulated for  $\chi^{(3)}_{1111}$  is an effective value of  $\chi^{(3)}$ . Unless noted otherwise, measurements were made at room temperature.

### 1.9.2 Two-Photon Absorption\*

Two-photon absorption (2PA) occurs in all materials at sufficiently high irradiance when the combined energy of two quanta of light matches a transition energy between two states of the same parity. The fundamental equation describing this loss of irradiance  $I$  with depth  $z$  in a material is

$$dI/dz + \beta I^2,$$

where  $\beta$  is the two-photon absorption coefficient. The coefficient  $\beta$  is proportional to the imaginary part of  $\chi^{(3)}(-\omega, \omega, \omega, -\omega)$ . The relationship between  $n_2$ ,  $\beta$ , and  $\chi^{(3)}$  is analogous to the relationship between  $n_0$ , the linear absorption coefficient  $\alpha$ , and the linear susceptibility  $\chi$ .

The two-photon absorption coefficient  $\beta$  depends not only on the frequency arguments but also on the state of polarization, propagation direction, and crystal symmetry as  $\beta$  is derived from the imaginary part of the third-order susceptibility tensor  $\chi^{(3)}$ . Relations for  $\chi^{(3)}$  for cubic crystals for several polarization orientations are presented in reference 1. These relations are valid for both the real and imaginary parts of  $\chi^{(3)}$ . For a linear or circularly polarized wave:

$$\beta(\text{LP}) = (32\pi^2 \omega/n^2 c^2) 3\chi_{1111}^{(3)}$$

and

$$\beta(\text{CP}) = (64\pi^2 \omega/n^2 c^2) 3\chi_{1122}^{(3)}.$$

Because these equations are in cgs units (esu),  $\beta$  is in cm s/erg rather than the more common mixed unit of cm/W.

Several methods have been used to measure the two-photon absorption coefficient in solids. Direct transmission measurements as a function of irradiance have been the primary method to determine absolutely calibrated values of  $\beta$  as well as two-photon absorption spectra. Several other techniques have been utilized to obtain calibrated as well as relative measurements and two-photon absorption spectra. These are listed in the table to follow. Many of these methods require calibration. Direct transmission experiments are best suited for absolute calibration. Because to give a value for  $\beta$  a measurement of the absolute irradiance is needed, single-beam experiments are most easily calibrated. Once absolute calibration is obtained at a single wavelength, relative measurements and spectral measurements can be calibrated.

## Techniques for Measuring Two-Photon Absorption

	Method	Ref.
AI1	Attenuation vs. irradiance for a single beam	3, 4
AI2	Attenuation vs. irradiance; two beams, usually one scanned in $\omega$	5
AIS	Attenuation vs. irradiance; broad spectrum treated simultaneously	6
C	Calorimetry	7
CR	Comparison of 2-photon loss and Raman gain	8, 9
EPR	Elliptical polarization rotation	10
FCC	F-center coloration	11
GTA	Gain measurement in a 2-photon-pumped amplifier	12
IA	Intracavity absorption	13
L	Luminescence or fluorescence	14, 15
HGE	Harmonic generation efficiency	16
PA	Photoacoustics	17
PC	Photoconductivity or photo-Hall effect	18, 19
TCN	Two-channel normalization	20
TL	Thermal lensing	21
TRT	Time-resolved transmission	22
Z-scan	A propagation method to measure $\beta$ and $n_2$	23

The experimental data on two-photon absorption coefficients ( $\beta$  in cm per GW) are presented in the following table. Materials are listed alphabetically. The method of measurement (using the above table), the pulse duration  $t_p$ , the input two-photon excitation energy  $2\hbar\omega$  (or range of energies if spectra are given), band gap energy  $E_g$  (if given in the reference) or absorption cutoff energy for wide-gap materials, and linear index  $n_0(\hbar\omega)$  are listed. The linear refractive indices are taken from reference 2.

The following shorthand notation is used in the table: Anisot. = anisotropy;  $\beta_l$  and  $\beta_c = \beta$  measured with linearly or circularly polarized light, respectively; Cleartran = brand name of heat-treated ZnS that makes it water clear and is grown by CVD = chemical vapor deposition; Dir. = direct; K = Kelvin; L = length; Mag. = magnetic; Pol. = polarized; SHG = second harmonic generation;  $T$  = temperature;  $t$  = time;  $E$  for SHG, means that the electric field and propagation direction are aligned for SHG phase matching.

The above data are from tables of S. Singh, Nonlinear optical materials, *Handbook of Laser Science and Technology, Vol. III: Optical Materials, Part 1* (CRC Press, Boca Raton, FL 1986), p. 54 ff and S. Singh, Nonlinear optical materials, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials*, (CRC Press, Boca Raton, FL, 1995), p. 237 ff. These references list the original sources of the data; they also contain additional nonlinear coefficients for other organic materials and powders.

### 1.9.5 Optical Phase Conjugation Materials\*

Photorefractive and semiconducting media are widely used for optical phase conjugation. Photorefractive materials are electrooptic photoconductors in which a refractive index grating can be written by charge generation, transport, and trapping. The most general interaction used to produce phase conjugation in photorefractive materials is degenerate four-wave mixing (DFWM).

Photorefractive materials may be classified into several major structural categories.<sup>1</sup>

Ferroelectric oxides, including  $\text{LiNbO}_3$ ,  $\text{BaTiO}_3$ ,  $\text{KNbO}_3$ , and  $\text{Sr}_{1-x}\text{Ba}_x\text{Nb}_2\text{O}_6$  (SBN). These materials have large electrooptic coefficients and are thus characterized by large values of diffraction efficiency, gain coefficient, and phase conjugate reflectivity. They are not effective photoconductors; thus the response times in these materials with typical CW beams are slow.

Cubic oxides or sillenites, including  $\text{Bi}_{12}\text{SiO}_{20}$  (BSO),  $\text{Bi}_{12}\text{GeO}_{20}$  (BGO) and  $\text{Bi}_{12}\text{TiO}_{20}$  (BTO). These materials have relatively small electrooptic coefficients, but they are good photoconductors, thus their response times are fast. In order to improve the phase conjugate reflectivity of the sillenites, applied DC or AC electric fields are generally used.

Bulk compound semiconductors, including GaAs, InP, and CdTe. These materials have small electrooptic coefficients but they are excellent photoconductors, with response times approaching the fundamental limit for bulk photorefractive materials. As with the sillenites, both DC and AC electric fields have been used to enhance the gain and phase conjugate reflectivity of semiconductor conjugators.

Other photorefractive materials include multiple quantum wells in the GaAs/AlGaAs or CdZnTe/ZnTe systems. These materials require an applied AC electric field; the periodic space charge field is due to periodic screening of the applied field. Photorefractive multiple quantum wells are faster than bulk semiconductors, but are relatively inefficient, because of the small thickness (typically 1  $\mu\text{m}$ ) of the active layers.

Organic crystals. Organic crystals are in principle easier to grow than inorganics, but they are also more difficult to handle. Only limited work on these materials has been performed.

Polymer films. These materials are simple and inexpensive to fabricate. In addition, there is great flexibility in modifying the structure to separately optimize the electro-optic properties and the charge transport properties.

<sup>1</sup> Fisher, R. A., Phase conjugation materials, *Handbook of Laser Science and Technology*, vol. V, *Optical Materials*, Part 3, (CRC Press, Boca Raton, FL 1987), p. 261.

\* This section was adapted from Pepper, D. M., Minden, M. L., Bruesselbach, H. W., and Klein, M. B., Nonlinear optical phase conjugation materials, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 467.

Semiconducting media possess a wide range of nonlinearities and materials are available at wavelengths from the visible spectral region to 10.6  $\mu\text{m}$  and beyond. The variety of nonlinearities in semiconductors results from the presence of free carrier states, as well as the bound carrier states which are present in all optical materials. Large concentrations of free carriers can be created through doping or through optical excitation. Semiconductors are particularly useful materials in the infrared spectral region because in most cases the nonlinear susceptibility increases rapidly as the operating wavelength increases. In addition, the susceptibility is larger in materials with smaller values of band gap energy.

Nonlinear processes in semiconductors can be broadly divided into two categories: resonant and nonresonant. In general, nonresonant nonlinearities involve virtual transitions and are quite fast. By contrast, resonant nonlinearities involve real transitions (usually involving free carrier generation), and are thus slower. Nonlinear processes used for phase conjugation via DFWM in semiconductors include anharmonic response of bound electrons, nonlinear motion of free carriers, plasma generation by valence-to-conduction band transitions, interband population modulation through optically induced carrier temperature fluctuations, saturation of exciton absorption in multiple quantum wells, and saturation of intersubband transitions in multiple quantum wells.

# GLASSES

## 2.1 Introduction

### Classification and Designation

Optical glasses are characterized and designated by their refractive index and dispersion. The most common measure is the refractive index at the wavelength of the He d line (587.6 nm) or the Na D line (589.3 nm). The difference in the refractive index at the hydrogen F (486.1 nm) and C (656.3 nm) lines,  $n_F - n_C$  is called the average or principal dispersion. The ratio  $(n_F - n_C)/(n_d - 1)$  is called the relative dispersion; the reciprocal of this quality is the Abbe number  $v_d$ . i.e.,

$$v_d = (n_d - 1)/(n_F - n_C).$$

A useful code for finding information on a specific optical glass composition is the mil spec designation. This is a six-digit number where the first three digits designate the refractive index  $n_d$  with the preceding “1” omitted and the last three digits designate the Abbe number  $v_d$  with the decimal point omitted. Thus a borosilicate glass BK 7 having an  $n_d = 1.51680$  and  $v_d = 64.17$  has a designation 517 642.

Glasses having  $n_d > 1.60$ ,  $v_d > 50$  or  $n_d < 1.60$ ,  $v_d > 55$  are called “crown” (K) glass; other glasses are called “flint” (F). These letters, plus others, are usually contained in the manufacturer's designation of optical glasses. Representative manufacturer's designations, glass types, and principal compositional components of commercial optical glasses are given in [Table 2.1.1](#). Designations vary with the country of origin and some alternate designations are given in parentheses. “Light” or “dense” indicate the relative amounts of heavy metal oxides such as PbO or La<sub>2</sub>O<sub>3</sub>. Glasses with prefixes U or IR denote extended ultraviolet or infrared transmitting glasses. Other designators are used for glasses for special applications such as LG—laser glass, FR—Faraday rotator glass, and AO—acoustooptic glass.

Various manufacturers of multicomponent optical glass use their own designations. [Table 2.1.2](#) relates these designations to actual composition in terms of major components. The table is comprehensive for Schott Optical Glass Inc. (Duryea, PA), Hoya Glass Works Ltd (Japan), Ohara Optical Glass Manufacturing Company, and Chance-Pilkington (England) glass designations. Corning Glass Works (France) uses another form of identification in which glass type does not play as significant a role in the name. A cross-reference chart from Corning is presented in [Table 2.1.2](#).

There are more than 200 types of optical glasses. Some are always available, others are generally available or available on short notice, and others are available on request. Section 2.2 presents properties of representative types of glasses that are generally preferred or standard glasses. Data are for Schott glasses; however, as indicated in [Table 2.1.2](#), comparable glasses are offered by other companies. Most optical glasses are oxides; only a few non-oxide optical glasses such as heavy metal fluorides and chalcogenides are available commercially. Some of these are included as specialty glasses in Section 2.3.

Figure 2.1.1 Glass map of the optical glass compositions in Table 2.1.1.

## Refractive Index

Optical glasses cover a general range of refractive indices  $n_d = 1.4$  to  $2.0$  and reciprocal dispersions  $v_d = 20$  to  $90$ . These are almost exclusively oxide glasses. The location of the glasses is shown in the glass map above, where the lines divide the main compositional types. The range of  $n_d - v_d$  in this figure is larger than that given in the ordinary glass catalogs so as to include low-index, low-dispersion fluoride glasses. Amorphous  $\text{SiO}_2$  and  $\text{BeF}_2$  are added to indicate the extrema for oxide and fluoride glasses. Many higher index chalcogenide glasses cannot be located in an  $n_d - v_d$  plot because the absorption edge extends into the visible and it is not always possible to measure  $v_d$ . Therefore for infrared materials, plots are made using a reciprocal dispersion based on measurements of refractive index at longer wavelengths.

Manufacturer's data sheets usually report the refractive index (the mean value for a number of melts) at a number of specific wavelengths. Wavelengths of a number of commonly used spectral lines and laser wavelengths are given in Table 2.1.3.

For interpolating values of the refractive index at the other wavelengths, glass manufacturers use an approximate dispersion formula derived from a power series expansion of the form

$$n^2 = A_0 + A_1 \lambda^{-2} + A_2 \lambda^{-4} + A_3 \lambda^{-6} + A_4 \lambda^{-8},$$

where the constants  $A_i$  are determined from a least squared fit of the measured values.

**Table 2.1.3**  
**Principal Wavelengths Used for Refractive Index Measurements**

Wavelength (nm)	Spectral line	Element	Wavelength (nm)	Spectral line	Element
365.0	i	Hg	656.3	C	H
404.7	n	Hg	706.6	r	He
435.8	g	Hg	768.2	A'	K
480.0	F'	Cd	852.1	s	Cs
486.1	F	H	1014.0	t	Hg
546.1	e	Hg	1060.0	Nd glass laser	
587.6	d	He	1064	Nd:YAG laser	
589.3	D	Na	1529.6		Hg
632.8	He-Ne laser		1970.1		Hg
643.8	C'	Cd	2325.4		Hg

Using the above equation, refractive indices in the wavelength range 365-1014 nm can be calculated to an accuracy of  $\pm 5 \times 10^{-6}$  or better. The thermal coefficient of refractive index depends on the wavelength, temperature, and pressure.

## Transmission

The transmission of optical glasses is frequently given in terms of the internal transmission  $T_i$  after correction for reflective losses  $R$ , that is,  $T_i = T/R$ . The deviation of  $T_i$  from 100% is a measure of absorption due to impurities and scattering due to defects. The internal transmittance is usually reported at a number of standard wavelengths from the ultraviolet to the infrared. The transmission ( $I/I_0$ ) and the absorption coefficient  $\alpha$  for a sample of length  $l$  are related by

$$\alpha l = \ln(I_0/I) = 2.303OD,$$

where  $OD = \log_{10}(I_0/I)$  is the absorbance or optical density. The absorption cross section  $\sigma$  is derived from  $\alpha = \sigma N$ , where  $N$  is the number of absorbing centers to unit volume.

Glasses exist that are optically transparent in the vacuum ultraviolet and in the mid-infrared. Variations of the ultraviolet and infrared absorption edges of representative optical glasses are illustrated below.

Figure 2.1.2. Ultraviolet absorption edge of representative optical glasses. Sample thicknesses: 5 mm except for  $\text{SiO}_2$  and LG 810 which are 2 mm.

Figure 2.1.3. Infrared absorption edge of representative optical glasses. Sample thicknesses: 2 mm.

### Thermal Properties

The temperature range in which a glass transforms from its solid state into a “plastic” state is called the transformation region. A transformation (annealing) temperature  $T_g$  is used to define this region and is determined from a standard thermal expansion measurement. The viscosity of the melt at  $T_g$  is approximately  $10^{13.4}$  poise. The softening temperature is that temperature at which, in a standard test, the glass deforms under its own weight and corresponds to a melt viscosity of  $10^{7.6}$  poise.

Thermal expansion varies the dimensions of glass and affects refractive optics subject to either uniform or gradient temperature variations. The coefficient of thermal expansion  $\alpha$  of glass ranges from near zero for special low expansion glasses such as titania-doped  $\text{SiO}_2$  and tailored glass ceramics to values greater than  $20 \times 10^{-6}/\text{K}$ . For optical glasses  $\alpha$  ranges from about  $4$  to  $16 \times 10^{-6}/\text{K}$ . The thermal expansion coefficient increases with increasing temperature, exhibiting a nonlinear increase up to about room temperature, followed by an approximately linear range until the glass begins to exhibit plastic behavior, and then a rapid increase with increasing structural mobility in the glass. Therefore, mean thermal expansion coefficients are given for a specific temperature range.

Because of its disordered atomic structure, the thermal conductivity of glass is much lower than that for crystalline materials. The thermal conductivity of optical glasses ranges from about  $0.5$  to  $1.5 \text{ W/m K}$ , being high for silica and low for glasses containing large quantities of heavy elements such as lead, tantalum, barium, and lanthanum. The thermal conductivity of glass increases with temperature but only slightly above  $300 \text{ K}$ .

### Mechanical Properties

The mechanical response of a glass to an applied force is described by various moduli. Optical glass catalogs usually list moduli such as Young’s modulus  $E$  (extension in tension) and the modulus of rigidity or shear  $G$  which are important for thermal and mechanical stress determinations. These are related to Poisson’s ratio  $\mu$  (ratio of lateral to longitudinal strain under unilateral stress) by

$$\mu + 1 = E/2G.$$

The bulk modulus  $B$  (1/isothermal compressibility) is related to the above moduli by

$$B = E/3(1 - \mu).$$

Elastic moduli can also be expressed in terms of the longitudinal and transverse sound velocities and the density.

The hardness of a glass is usually measured from the indentation of Knoop or Vickers penetrators. Values (Knoop) for oxide glasses range from  $\sim 250$  for high-lead-content glasses to  $>600 \text{ kg/mm}^2$  for lanthanum crown glasses. The Knoop hardness generally correlates with Young's modulus.

The stress-optical coefficient  $K$  varies with glass type and wavelength. It is usually positive, although it can become negative (so-called Pockels glasses) for silicate glasses having a high lead content. The stress-optical coefficient is measured in units of 1 Brewster =  $(\text{TPa})^{-1} = 10^{-12} \text{ m}^2/\text{N}$ . Values of  $K$  are included in the table and generally range from  $-2 < K < 4 \text{ TPa}^{-1}$  for oxide glasses to  $-40 < K < 20 \text{ TPa}^{-1}$  for chalcogenide glasses.

## Chemical Properties

An important consideration for many optical glasses is their chemical reactivity with slurries during cutting and polishing of components such as lenses, windows, and prisms and with its environment where it may be subject to chemical attack by water, water vapor, gases, acids, etc. Corrosion, dimming, and straining occur and vary greatly depending on the chemical composition of the glass. No simple test and parameter is sufficient to characterize chemical reactivity under all conditions. Thus many terms and tests are used to rank glasses with respect to their resistance to acids, straining, climate, weathering, etc. Manufacturers typically list several categories of acid and alkali resistance to cover the above ranges.

## 2.2 Commercial Optical Glasses

Data for selected commercial optical glasses representative of the various glass types are presented in Sections 2.2 and 2.3 are from manufacturers' catalogs and data sheets and from the *Handbook of Optics*, Vol. II (McGraw-Hill, New York, 1995), chapter 33, and references cited therein.

## 2.3 Specialty Optical Glasses

Designation	Glass type	Composition
Vycor® (Corning 7913)	silica	96% SiO <sub>2</sub>
Pyrex® (Corning 7740)	borosilicate	SiO <sub>2</sub> –B <sub>2</sub> O <sub>3</sub> –Na <sub>2</sub> O–Al <sub>2</sub> O <sub>3</sub>
<i>Ultraviolet transmitting glasses</i>		
Corning 9741	alkali borosilicate	SiO <sub>2</sub> –B <sub>2</sub> O <sub>3</sub> –Na <sub>2</sub> O + . . .
Schott UBK 7	borosilicate	SiO <sub>2</sub> –B <sub>2</sub> O <sub>3</sub> –Na <sub>2</sub> O–CaO + . . .
ULTRAN 30 (Schott)		
Hoya UBS250		
<i>Infrared transmitting glasses</i>		
Fused germania	germanium oxide	100% GeO <sub>2</sub>
Corning 9753	calcium aluminate	SiO <sub>2</sub> –CaO–Al <sub>2</sub> O <sub>3</sub>
Corning 9754	calcium aluminate	GeO <sub>2</sub> –CaO–Al <sub>2</sub> O <sub>3</sub> –BaO–ZnO
Barr&Stroud BS-39B	calcium aluminate	CaO–Al <sub>2</sub> O <sub>3</sub> –MgO
Kigre BGA	germanate	BaO–Ga <sub>2</sub> O <sub>3</sub> –GeO <sub>2</sub>
Schott IRG 2	germanate	
Schott IRG 9	fluorophosphate	P <sub>2</sub> O <sub>5</sub> + . . .
Schott IRG 11	calcium aluminate	CaO–Al <sub>2</sub> O <sub>3</sub> + . . .
Schott IRG 100	chalcogenide	
Arsenic trisulfide	chalcogenide	100% As <sub>2</sub> S <sub>3</sub>
Arsenic triselenide	chalcogenide	100% As <sub>2</sub> Se <sub>3</sub>
AMTIR-1	chalcogenide	Ge <sub>33</sub> As <sub>12</sub> Se <sub>55</sub>
AMTIR-3	chalcogenide	Ge <sub>28</sub> As <sub>12</sub> Se <sub>60</sub>
<i>Fluoride glass</i>		
Ohara HTF-1	fluoride	
<i>Low expansion glasses</i>		
CLEARCERAM 55 (Ohara)	glass ceramic	
CLEARCERAM 63 (Ohara)	glass ceramic	
LE30 (Hoya)	glass ceramic	aluminosilicate
Zerodur (Schott)	glass ceramic	SiO <sub>2</sub> –Al <sub>2</sub> O <sub>3</sub> –P <sub>2</sub> O <sub>5</sub> + . . .
ULE (Corning 7971)	glass ceramic	SiO <sub>2</sub> –TiO <sub>2</sub>
<i>Athermal glasses</i>		
Schott PSK 54	dense phosphate crown	P <sub>2</sub> O <sub>5</sub> –(B,Al) <sub>2</sub> O <sub>3</sub> –R <sub>2</sub> O–MO
Schott TiF 6	titanium flint	SiO <sub>2</sub> (B <sub>2</sub> O <sub>3</sub> )–TiO <sub>2</sub> –Al <sub>2</sub> O <sub>3</sub> –KF
<i>Acoustooptic glasses</i>		
Hoya AOT-5	tellurite	TeO <sub>2</sub> + . . .
Hoya AOT-44B	tellurite	TeO <sub>2</sub> + . . .
<i>Low nonlinear refractive index glass</i>		
Schott FK 54	fluorophosphate	P <sub>2</sub> O <sub>5</sub> + . .

## 2.4 Fused (Vitreous) Silica\*

Different types of silica have been commercially available from several suppliers (Corning Incorporated, Hereaus Amersil, Thermal Syndicate Ltd, General Electric Co., Quartz et Silice [France], Dynasil Corp. of America, NSG Quartz [Japan], Westdeutsche Quarzschmelze GmbH (Germany), Nippon Glass [Japan]). The glasses are compositionally the same except for metallic impurities, structural defects, and water content, but these differences and fabrication variations cause the properties of the silicas to differ significantly. The vitreous silicas can be distinguished by the source of raw material used and the process of melting or consolidating the raw material into bulk vitreous silica. It is produced commercially from naturally occurring quartz of high purity and from silicon tetrachloride liquid or vapor or from tetraethyl orthosilicate liquid. These precursors are processed in several different ways. Hetherington et al.<sup>1</sup> divided the different silicas into four types based on manufacturing method

In one method, naturally occurring quartz is purified to varying degrees by preselection of clean crystalline material, fragmented to a fine powder, and fused to bulk glass. The fusion is performed by electric melting in a refractory crucible or container under vacuum, an inert atmosphere, or a hydrogen atmosphere. This produces a type of vitreous silica designated as type I. If the same raw material is fused using an oxyhydrogen torch or an isothermal plasma torch, then the resultant vitreous silica is designated type II. The principal differences between these are the lower hydroxyl content and different impurities of type I.

Melting atmosphere influences the glass structure and properties. After fusion, various amounts of hot working are performed to homogenize the resultant silica glasses. The synthetic precursors, mainly  $\text{SiCl}_4$ , are fused to a solid glass with an oxyhydrogen torch producing a very pure but wet material denoted type III. These precursors also can be used to produce vitreous silica under relatively dry conditions such as those present using an oxygen or argon plasma torch. This material has been designated type IV. The principal difference between types III and IV fused silica is OH content which introduces strong absorption around  $2.8\text{ }\mu\text{m}$ .

Using similar torches but depositing on a cooler bait, the synthetic material can also be formed into a porous boule that is subsequently consolidated to a fully dense silica boule in a furnace. Consolidation of the porous silica body can involve firing in different atmospheres and can be achieved at a temperature several hundred degrees below that used for fusion of the type III and type IV silica. The commercialization of this latter technology has occurred principally in the fabrication of optical fibers based on vitreous silica. Certain manufacturers have used this technology for the fabrication of bulk silica. This vitreous silica is similar to type III or IV depending on the method of consolidation, but the processing is sufficiently different that it should be considered in a class by itself. Although there is varied opinion on what kind of silica should be designated type V, there is general agreement that there are many types of vitreous silica which, because of the dependence on fabrication, do not fall into the earlier established four types. Fleming<sup>2</sup> has viewed the consolidated soot sufficiently close to type III and IV that it is designated type V in the following tables. Fluoride-doped, low-OH silica glass has recently been developed for deep UV and vacuum UV applications and is designated as modified silica.<sup>3</sup> Optical, mechanical, and thermal properties of the various types of silicas are compared below.

## 2.8 Electrooptic Properties

Electric-field-induced birefringence, the DC electrooptic Kerr effect, is given by

$$n = n_{||} - n_{\perp} = \lambda B E^2,$$

where  $\lambda$  is the wavelength in centimeters,  $E$  is the applied electric field strength in volts per centimeter,  $n_{||}$  and  $n_{\perp}$  are the refractive indices in the directions parallel and perpendicular to the electric field, and  $B$  is the Kerr constant in centimeters per volt squared. In terms of the third-order nonlinear susceptibilities [in electrostatic units (esu)],

$$\chi_{\text{eff}}(-\omega, \omega, 0, 0) = \chi_{1111}^{(3)} - \chi_{1122}^{(3)} = (9\lambda B n / 24\pi) 10^4.$$

A positive electrooptic constant is obtained when the induced index change in the direction of the applied field is larger than the induced index change for the perpendicular direction. A negative sign for  $B$  implies that the major effect is a large decrease in the refractive index in the direction of the electric field.

## 2.9 Elastooptic Properties

The stress optic coefficients are defined as

$$K_p = dn_p/dP$$

and

$$K_s = dn_s/dP,$$

where the ordinary and extraordinary indices of refractive are designated  $n_s$  and  $n_p$ , respectively, according as the light polarization is perpendicular ( $s$ ) or parallel ( $p$ ) to the pressure vector. The elastooptic coefficients can be calculated from the experimentally determined values of the stress optic coefficients through the relations

$$p_{11} = 2E[2\mu K_s + (1 - \mu)K_p]/[n^3(2\mu - 1)(\mu + 1)]$$

and

$$p_{12} = 2E[\mu K_p + K_s]/[n^3(2\mu - 1)(\mu + 1)],$$

where  $E$  is the elastic modulus and  $\mu$  is Poisson's ratio.

The elastooptic coefficients for several representative glasses are given below.

Glass	Wavelength ( $\mu\text{m}$ )	Elastooptic Coefficients			Ref.
		$p_{11}$	$p_{12}$	$p_{44}$

3. Eschler, H. and Weidinger, F., *J. Appl. Phys.*, 46, 65 (1975).

Two acoustooptic figures of merit,  $M_1$  and  $M_2$ , are:

$$M_{1i} = n^7 p_{1i} / \rho v_i$$

and

$$M_{2i} = n^6 p_{1i} / \rho v_i^3.$$

A compilation of these properties for most of the optical glasses carried in the Schott Optical Glass Catalog is given in Modification of the refractive index of optical glass by tensile and compressive stresses, *Schott Technical Information TI No. 20*, 4/88 and in Gottfried, M. and Singh, N. B., *Elastooptic materials*, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 415.

## 2.10 Nonlinear Optical Properties

### 2.10.1 Nonlinear Refractive Index\*

Nonlinear refraction is commonly defined either in terms of the optical field intensity  $I$

$$n = n_0 + \gamma I$$

or in terms of the average of the square of the optical electric field  $\langle E^2 \rangle$

$$n = n_0 + n_2 \langle E^2 \rangle,$$

where  $n_0$  is the ordinary linear refractive index,  $\gamma$  is the nonlinear refractive coefficient, and  $n_2$  is the nonlinear refractive index. The conversion between  $n_2$  and  $\gamma$  is given by

$$n_2[\text{cm}^3/\text{erg}] = (cn_0/40\pi) \gamma[\text{m}^2/\text{W}] = 238.7 n_0 \gamma[\text{cm}^2/\text{W}],$$

where  $c$  is the speed(in m/s) of light in vacuum. In terms of third-order susceptibility tensor  $\chi^{(3)}(-\omega, \omega, \omega, -\omega)$  of a medium, the nonlinear refractive indices for a linearly polarized wave and for a circularly polarized wave in an isotropic material are

$$n_2(\text{LP}) = (12\pi/n_0) \chi^{(3)}_{1111}(-\omega, \omega, \omega, -\omega)$$

and

$$n_2(\text{CP}) = (24\pi/n_0) \chi^{(3)}_{1122}(-\omega, \omega, \omega, -\omega).$$

The two-photon absorption coefficient  $\beta$  is proportional to the corresponding imaginary part of  $\chi^{(3)}(-\omega, \omega, \omega, -\omega)$ . The relationship between  $n_2$ ,  $\beta$ , and  $\chi^{(3)}$  is analogous to the relationship between  $n_0$ , the linear absorption coefficient  $\alpha$ , and the linear susceptibility  $\chi$ .

The nonlinear refractive index is not a unique quantity for a given material because a number of physical mechanisms contribute to the polarization that is cubic in the applied optical electric field. The mechanisms that contribute most strongly to  $n_2$ , and their characteristic time scales (in parentheses) are bound electrons ( $10^{-15}$  s), optically created free carriers ( $>10^{-12}$  s), Raman-active optical phonons ( $10^{-12}$  s), electrostriction ( $>10^{-9}$  s), and thermal excitation ( $\sim 10^{-9}$  s).

Several methods listed below have been employed to measure  $n_2$ . The details of the measurements determine the relative contributions from the various possible physical mechanisms to the measured  $n_2$ . In general, experiments done with picosecond pulses and nondegenerate mixing are less likely to be affected by the “slow” electrostrictive or thermal effects than those done in the nanosecond pulse regime and with degenerate mixing. Most of the measurements include the effects of both electronic and vibrational (Raman) contributions to  $n_2$ .

In the following tables values of the parameters in parentheses were calculated by Chase and Van Stryland<sup>1</sup> from the quantities reported in the original references. Refractive indices in parentheses were obtained from extrapolation of available data. For noncubic crystals, or for cubic crystals where the polarization is not along a cube axis or is not specified in the original reference, the value tabulated for  $\chi^{(3)}_{1111}$  is an effective value of  $\chi^{(3)}$ .

---

\* This section was adapted from Chase, L. L., and Van Stryland, E. W., Nonlinear refractive index: inorganic materials, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 269.

Boling, Glass, and Owyong<sup>15</sup> derived an empirical formula relating  $n_2$  at wavelengths much longer than the interband absorption to the linear refractive index and its dispersion. This formula for estimating  $n_2$  is accurate to within about 25% for a wide range of crystals and glasses.<sup>6,16</sup> The equation is generally not applicable to chalcogenide glasses. Lines of constant  $n_2$  predicted from this equation are plotted as a function of  $n_d$  and  $v_d$  in the figure below and are superimposed on regions of known oxide and fluoride glasses.

## 2.11 Special Glasses

### 2.11.1 Filter Glasses

There are three general types of filter glasses: (1) colorless—optical glasses with different ultraviolet cutoffs, (2) ionically colored by heavy metal or rare earth ions, and (3) colloiddically colored. The optical, thermal, and mechanical properties, chemical resistance, and internal quality of these glasses are carefully controlled and are generally similar to those of optical glasses. Manufacturer's catalogs should be consulted for specific transmission curves and transmittance. Several of the colored filter glasses exhibit photoluminescence [see W. H. Turner, Photoluminescence of color filter glasses, *Appl. Opt.* 12, 480 (1973) and tables later in this section].

Glass filters may be classified according to their optical properties—short wavelength cutoff, long wavelength cutoff, bandpass, band blocking, and neutral density. Filter glasses produced by major manufacturers are listed by groups in the following table.

Commercial Filter Glasses				
	Corning		Hoya	Schott
	Glass no.	C.S. no.		
UV cutoff filters (visible and IR transmitting)	7940 UV	9-57	—	—
	7940	9-58	—	—

## 2.11.2 Laser Glasses

Compositions of commercial laser glasses are rarely published. Most current glasses are similar to the following:

- Silicate glasses of the  $\text{Li}_2\text{O-CaO-SiO}_2$  or  $\text{Li}_2\text{O-Na}_2\text{O-SrO-SiO}_2$  type. Examples of these glasses include the Schott LG-680, Kigre Q-246, and Hoya LSG-91H. These glasses generally have excellent physical properties and, because of their high  $\text{Li}_2\text{O}$  content, can be strengthened by ion exchange. Therefore, these glasses can be very resistant to thermal shock.
- Potassium-barium-phosphate glasses with a high cross section for stimulated emission. Examples of these glasses include Schott LG-760, Hoya LGH-80, and Kigre Q-98. These glasses are often modified with  $\text{Na}_2\text{O}$ ,  $\text{Li}_2\text{O}$ ,  $\text{Al}_2\text{O}_3$ , etc. to produce a glass with a near-zero optical distortion. Examples of these athermal glasses include Schott LG-LG-760, Hoya LGH-8, and Kigre Q-98.
- Lithium-aluminum-phosphate glasses with a relatively high thermal shock resistance for high average power applications. These glasses can usually be ion exchanged to further improve their resistance to breakage. Examples of these glasses include Schott APG-1 and Hoya HAP-4.
- Fluorophosphate glasses feature a low nonlinear refractive index which reduces spatial beam breakup due to small scale self-focusing. An example is Schott LG-810.

In addition to commercial laser glasses, a large number of different glasses have been used in experimental lasers. Below is a summary of the range of spectroscopic properties that have been obtained for the  $^4\text{F}_{3/2}-^4\text{I}_{11/2}$  transition of  $\text{Nd}^{3+}$ . For additional data of glass lasers, see the *Handbook of Lasers* (CRC Press, Boca Raton, FL, 2000), p. 161.

**Spectroscopic Properties for  $\text{Nd}^{3+}$  Observed in Different Glasses at 295 K**

Host glass	Refractive index ( $n_d$ )	Cross section ( $\text{pm}^2$ )	Peak wavelength ( $\mu\text{m}$ )	Effective linewidth (nm)	Radiative lifetime ( $\mu\text{s}$ )
<b><u>Oxides</u></b>					
Silicate	1.46–1.75	0.9–3.6	1.057–1.088	34–55	170–1090

### 2.11.3 Faraday Rotator Glasses

#### Diamagnetic Glasses

The Verdet constant of diamagnetic glasses is proportional to the dispersion of the refractive index,  $dn/d\lambda$ . Thus high index, large dispersion glasses are generally used for Faraday rotation applications. Data for representative diamagnetic glasses are given below.\*

<b>Schott BK 7</b>	<b>Wavelength (nm)</b>

## 2.11.4 Gradient-Index Glasses

Gradient-index (GRIN) glasses are ones in which the index of refraction varies spatially within the glass. A radial gradient is one that is symmetric about a line; therefore the surfaces of constant index of refraction are cylinders. There are two commonly used mathematical representations for such gradients. The first, used to specify products manufactured by Nippon Sheet Glass, is  $N(r) = N_0(1 - Ar^2/2 + h_4r^4 + h_6r^6 + \dots)$ ; the second is  $N(r) = N_{00} + N_{10}r^2 + N_{20}r^4 + \dots$ . In both cases, the quadratic coefficient determines the focal length, numerical aperture, and other first-order properties of the lens. The higher-order coefficients determine the image quality.

The tables below present catalog data for Nippon Sheet Glass (NSG) materials and those of Gradient Lens Corporation (GLC) together with calculated maximum numerical aperture (NA) and quarter-pitch length. Other diameters and numerical apertures may be available; the reader should contact the appropriate vendor for current data.

**NSG Radial Gradient Lenses (Selfoc)**

	SLS	SLS	SLW	SLW	SLW	SLW	SLH

## 2.11.6 Athermal Glasses

Athermal glass compositions are selected such that the optical path length, defined as the refractive index times the actual geometric distance the light traverses in the glass, is independent of temperature. The change in optical path length  $\Delta W$  with temperature is

$$\Delta W = s[\alpha(n - 1) + dn/dT]\Delta T = sGT,$$

where  $s$  is the actual distance in the glass,  $\alpha$  is the coefficient of thermal expansion,  $n$  is the refractive index, and  $T$  is the temperature.  $G$  is the thermo-optical coefficient. For  $\Delta w$  to approach zero, the gradient of the refractive index as a function of temperature must be negative. Examples of glasses with this property can be found in the FK, PK, PSK, SSK, BaLF, F, TiF, and BaSF families on the glass map. Data for several representative athermal optical and laser glasses are given in the table (see, also, sections 2.2.2 and 2.9.2).

Properties of Athermal Glasses				
Glass type	$n_d$	$v_d$	Thermal expansion coefficient $\alpha$ (10 <sup>-6</sup> /K)*	$dn/dT$ (10 <sup>-6</sup> /K)**

## 2.11.7 Acoustooptic Glasses

Acoustic waves create a time-varying refractive index grating in a material via the photoelastic effect. The grating spacing is equal to the acoustic wavelength; the grating depth is determined by the drive power of the transducer. A light beam traversing the medium is deflected by the grating at the Bragg angle  $\Theta_B$  from the normal to the sound propagation direction given by

$$\sin \Theta_B = (1/2)\lambda / \Lambda,$$

where  $\lambda$  and  $\Lambda$  are the wavelengths of the light and sound beams. The diffraction efficiency for a transducer of height  $H$  and interaction length  $L$  is

$$I/I_0 = (\pi^2/2)(L/H)(n^6 p^2 / v n^3) P_a / \lambda^2$$

where  $P_a$  is the acoustic power,  $p$  is the photoelastic constant,  $\rho$  is the density, and  $v$  is the sound velocity. Thus an acoustooptic material, in addition to having low losses at the acoustic and optical wavelengths, should also have a large index of refraction and small sound velocity.

A figure of merit for an acoustooptic material is  $M = n^6 p^2 / \rho v^3$ . Properties and figures of merit for several glasses are compared below.

Properties of Acoustooptic Glasses						
Glass	Transmission range ( $\mu\text{m}$ )	Acoustic wave polar.	Sound velocity (km/sec)	Optical wave polar.	Refract. index (632.8 nm)	Relative merit <sup>(a)</sup>
fused silica ( $\text{SiO}_2$ )	0.2–4.0	long.	5.96	$\perp$	1.46	1.0
lead silicate (Schott SF 4)	0.38–1.8	long.	3.63	$\perp$	1.62	3.0
lead silicate (Schott SF 59)	0.46–2.5	long.	3.20	$  $ or $\perp$	1.95	12.6

## 2.11.8 Abnormal Dispersion Glass

Various relative partial dispersions

$$P_{X,Y} = (n_X - n_Y)/(n_F - n_C)$$

are defined for other wavelengths  $x$  and  $y$ . The relative partial dispersion of most glasses obeyed a linear relationship on  $v_d$  of the form

$$P_{X,Y} \approx a_{XY} + b_{XY} v_d ,$$

where  $a$  and  $b$  are constants. It is not possible to correct for second-order chromatic aberrations using so-called “normal” glasses that satisfy this equation. Because of the linear relationship between the relative partial dispersions and Abbe number, the difference in partial dispersions will always be the same for normal glasses.

Correction for second-order chromatic aberration (secondary spectrum) is accomplished using glasses with equal partial dispersions for different Abbe values (the corrected systems are called apochromats). These abnormal dispersion glasses depart from the “normal line” and the linear relationship above. The relative dispersion  $(n_g - n_F)/(n_F - n_C)$  of optical glasses is plotted in the figure below and shows the magnitude of the deviations from the normal line that are possible. The deviations can be either positive or negative. Optical glass catalogs list deviations of the relative partial dispersions from the normal for glasses covering a wide range of  $v_d$  values.

Deviation of the relative partial dispersion  $P_{g,f}$  of optical glasses from the normal line (Schott Optical Glass Catalog).

### Section 3

### POLYMERIC MATERIALS

Of the large number of known polymers, several exhibit useful optical properties. Various properties of optical plastics are compared with those of glasses below. The documentation of optical properties and the accuracy of data on plastics are generally not comparable to that of optical glasses. In addition, mechanical and chemical resistance properties should be checked with the material supplier because they may vary widely within a polymer group. Numerous caveats about the use and application of plastics in optical systems are noted in reference 1.

Property	Plastic	Glass
<b>Optical</b>		
Refractive index ( $n_d$ )	1.31–1.65	1.28–1.95
Abbe number ( $v_d$ )	92–20	91–20
Index homogeneity	$\pm 1 \times 10^{-4}$	$\pm 1 \times 10^{-6}$
Index change with temperature ( $10^{-6} \text{ K}^{-1}$ )	–143 to –100	–8.5 to 6.0
Birefringence (nm/cm)	60–80,000	5
Transmission range (nm)	200–2500	150–3500
<b>Mechanical</b>		
Density ( $\text{g/cm}^3$ )	0.83–1.46	2.3–6.3
Young modulus ( $10^3 \text{ N/mm}^2$ )	1–10	46–129
Poisson’s ratio		0.192–0.309
<b>Thermal</b>		
Expansion coefficient ( $10^{-6} \text{ K}^{-1}$ )	25–130	3.7–14.6
Heat capacity ( $\text{J g}^{-1} \text{ K}^{-1}$ )	1–2	0.31–0.89
Thermal conductivity ( $\text{W m}^{-1} \text{ K}^{-1}$ )	0.1–0.3	0.51–1.28
Softening temperature ( $^{\circ}\text{C}$ )	360–430	750–1100

From Cook, L. M. and Stokowski, S. E., Filter materials, *Handbook of Laser Science and Technology, Volume IV: Optical Materials, Part 2* (CRC Press, Boca Raton, FL, 1995), p. 151.

Common optical plastics include:

- polymethyl methacrylate (PMMA) (acrylic)
- polystyrene (styrene) (PS)
- methyl methacrylate styrene copolymer (NAS)
- stryrene acrylonitrile (SAN), acrylic/styrene copolymer
- polycarbonate (PC)
- polymethylpentene (TPX)
- acrylonitrile, butadienne, and styrene terpolymer (ABS)
- nylon, amorphous polyamide
- polyetherimide (PEI)
- polysulfone
- allyl diglycol carbonate (CR-39)
- Telfon (Telfon AF<sup>®</sup>) (TPFE), fluorinated-(ethylenic-cyclo oxyaliphatic substituted ethylenic) copolymer

In the following tables properties of these and other optical plastics are given in order of decreasing index of refraction.

3.1 Optical Plastics

Properties of Optical Plastics–I					
Polymer	Trade name	Manufacturer	Density (g/cm <sup>3</sup> )	Index n <sub>D</sub>	Abbe v <sub>D</sub>
Polyetherimide (PEI)	Ultem	G.E. Plastics	1.27	1.658	
Polyarylsulfone	Radel	Amoco Performance	1.37	1.651	
Polyurethane	Isoplast 301	Dow	1.2	1.64–1.65

	Shinkolite P	Mitsubishi Rayon	1.19	1.491	57.4
Polymethylmethacrylate impact modified, 20%	MI-7	Rohm and Haas	1.17	1.49	
impact modified, 40%	DR-G	Rohm and Haas	1.15	1.49	
Poly(4-methylpentene-1)	TPX RT-18	Mitsui Plastics	0.833	1.463	56.3
Cellulose acetate butyrate (CAB)	Tenite	Eastman	1.15–1.2	1.46–1.49	51.9
Fluoropolymer (TPFE)	Teflon AF 1600	DuPont	1.8	1.32	92

### Optical Transmission

Optical plastics transmit well in the visible and the near infrared, but absorb strongly in the ultraviolet (fluoropolymers are an exception) and throughout the infrared. Most plastics degrade somewhat both in physical and optical properties when exposed to ultraviolet radiation.

Transmission spectra of optical plastics. sample thickness: 3.2 mm.

## Properties of Optical Plastics–II

Polymer	Relative haze <sup>a</sup>	Hue <sup>b</sup>	Deflect. <sup>c</sup> temp. (°C)	Comments
Polyetherimide (PEI)	light	amber	200	Good thermal/chemical resistance, high color but good in near IR
Polyarylsulfone	light	yellow	204	Tough
Polyurethane	light	colorless	88	Can be custom tailored, good chemical resistance
Polysulfone	light	yellow	174	Good thermal and moisture stability, high temperature
Polyarylate	noticeable	light straw	158	High temperature, good UV resistance
Poly $\alpha$ -methylstyrene	slight	colorless	n/a	Brittle, can be modifier for K resin
Polyamide, amorphous nylon	slight	light straw	110	Tough, hard
Polystyrene (PS)	low	colorless	82/110	Low haze grades available
Polyamide, amorphous nylon	noticeable	colorless	123	Good abrasion resistance, moisture sensitive
Polycarbonate (PC)	slight	light straw	123/129	Very tough, high impact
Polystyrene co-maleic anhydride (SMA)	slight	colorless	96	Brittle
Modified polyestercarbonate	slight	light straw	107	Processes at lower temperature
Polystyrene-butadiene copolymer	noticeable	light straw	76	Tough
Polystyrene-coacrylonitrile $\partial$ 8 (SAN)	slight	light straw	93/104	Tougher than polystyrene
Polyester (PETG)	slight	light straw	70	Film extruding
Polyamide, amorphous (nylon type 6/3)	noticeable	straw	124	Good abrasion resistance
Polystyrene co-methylmethacrylate (2:1) (SMMA)	slight	colorless	98	Optical quality
Amorphous polyolefin from dicyclopentadiene	n/a	n/a	T <sub>g</sub> = 141	Optical quality, very low moisture
Acrylonitrile-butadiene-styrene terpolymer (ABS)	noticeable	yellow	79	Tough
Polyamide, amorphous (nylon type 12)	noticeable	straw	150	Good abrasion resistance
Polystyrene co-methylmethacrylate (1:2) (SMMA)	slight	colorless	99	Optical quality
Amorphous polyolefin (APO)	slight	light straw	123	Optical quality
Dicyclopolyolefin	slight	light straw	107	Very low moisture (0.01%)
Epoxy molding compound	slight	colorless	120	Semiconductor embedment
Epoxy casting resin			T <sub>g</sub> = 110	Two-part casting resin
Tricyclodecyl co-methacrylate (TCDMA)	low	colorless		Lower moisture than PMMA (1.2%)
Low moisture acrylic	sligth	light straw	103	Optical quality
Allyl diglycol carbonate	low	light straw	91	Cast thermoset, hard
			55–65	Ophthalmic use

**Properties of optical plastics—II—continued**

Polymer	Relative haze <sup>a</sup>	Hue <sup>b</sup>	Deflect. <sup>c</sup> temp. (°C)	Comments
Polymethylmethacrylate PMMA, acrylic	low to slight	light straw to colorless	72–102	Optical quality, hard, widely used, scratch resistant
Impact modified, 20%	light	colorless	85	Tougher than PMMA
Impact modified, 40%	light	colorless	79	Tough, will creep with mild force
Poly(4-methylpentene-1)	slight	colorless	90 at 66 psi	Unusual properties, lowest density of all thermoplastics, infrared transmission, very tough
Cellulose acetate butyrate (CAB)	noticeable	light straw	43–88	Tough
Fluoropolymer (TPFE)	noticeable	colorless	154	Very low index of refraction, good ultraviolet transmission.

<sup>a</sup>Relative haze estimates: low (<0.7%); slight (to 1.5 %); light (to 3%); noticeable (>3%).

<sup>b</sup>Hue (yellowness) estimates: colorless, light straw, straw, yellow, amber.

<sup>c</sup>Heat deflection temperature at 264 psi.

The above tables are from D. Keyes, Optical plastics, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), pp. 85–94.

**Loss Contributions (in dB/km) for PS, PMMA, and PMMA-d8 Core Fibers**

Adapted from a table of J. D. Lytle, *Handbook of Optics*, Vol. II (McGraw-Hill, New York, 1995), Chapter 34 ( with additions).

Being carbon-based materials, the index of refraction and dispersion of polymers differ significantly from those of glasses and crystals. The locations of optical plastics relative to optical glasses are shown in the refractive index–Abbe number diagram below.

### 3.3 Nonlinear Optical Properties

Abbreviations	Material
3-BCMUr	Red form of poly-3-BCMUr
3-DDCTP	Poly(3-dodecylthiophene)
4-BCMUr	Red form of poly-4-BCMUr
4-BCM Uy	Yellow form of poly-4-BCMUr
AO	Acridine orange
AY	Acridine yellow
BBB	Poly(6,9-dihydro-6,9-dioxobisbenzimidazo[2,1 <i>b</i> :1',2' <i>j</i> ]benzo[1 <i>mn</i> ][3,8]phenanthroline-3,12-diyl)
BBL	Poly{(7-oxo-7,10H-benz[de]imidazo[4',5':5,6]benzimidazo[2,1- <i>a</i> ]isoquinoline 3,4:10,11-tetrayl)-10-carbonyl}
BBPEN	Bis[ <i>n</i> -butyl, 2-phenyl-1,2-ethenedithiolato(2-)- <i>S,S'</i> ] nickel
BSQ	1,3-Bis(4'- <i>N,N</i> -dibutylamino-2'-hydroxyphenyl)-cyclobutene-2,4-dione
DCV	4- <i>N,N</i> -Diethylamino-4'- <i>b,b</i> -dicyanovinyl (azobenzene)
DEANS	4-Diethylamino-4'-nitrostilbene
DNBA	4-Nitrobenzylidenyl (4'- <i>N,N</i> -dimethylaminoanilide)
DNTA	4-Nitrothenylidenyl (4'- <i>N,N</i> -dimethylaminoanilide)
DR1	Disperse red 1
ISQ	1,3-Bis(3',3'-dimethyl-2'-indoleninylidenyl)-cyclobutene-2,4-dione
LTFPG	Lead-tin fluorophosphate glass
MDCB	<i>m</i> -Dicyanobenzene
MDNB	<i>m</i> -Dinitrobenzene
Mg:OPTAP	Magnesium octaphenyl tetra-azaporphyrin
MNA	2-Methyl-4-nitroaniline
MV757	MV757 commercial epoxy resin
NFAI	5-Nitro(2-furanacroleindenyl (4'- <i>N,N</i> -dimethylaminoanilide)
NPCV	4- <i>N,N</i> -Dibutylamino-4'-( <i>b</i> -cyano- <i>b</i> -(4≤-nitrophenyl) vinyl) (azobenzene)
OMPS	Poly( <i>n</i> -octylmethylpolysilane
PBT	Poly- <i>p</i> -phenylenebenzobisthiazole
PC	Polycarbonate
PDES	Polydiethynylsilane
PDTT	Polydithieno(3,2- <i>b</i> ,2',3'- <i>b</i> )thiophene
PMMA	Poly(methyl) methacrylate
PPMS	Polyphenylmethylsilane
PPV	Poly ( <i>p</i> -phenylene vinylene)
PS	Polysilane
PT	Polythiophene
PTS	Bis-( <i>p</i> -toluene sulfonate) of 2,4-hexadiyne-1,6 diol (polydiacetylene)
PTS-PDA	Single crystal poly PTS polydiacetylene
PVK	Poly- <i>N</i> -ninyl carbazole
rB	Rhodamine B
SiNc	Silicon naphthalocyanine
SiPc	Silicon phthalocyanine
TCDU:	Bis-(phenylurethane) of 5,7-dodecadiyne-1,2-diol (polydiacetylene)
TCV	4- <i>N,N</i> -Diethylamino-4'-tricyanovinyl (azobenzene)
TNF	2,4,7-Trinitrofluorenone
TPO-N	Thiophene oligomer with N units

## Section 4

### METALS

Metals are used in optical systems as reflective optical components, optical thin films, structural elements, and mirror substrates. For these optical applications only a limited number of metals are useful. The materials and properties included in this section are therefore necessarily selective.

Depending upon the application, various physical, optical, mechanical, and thermal properties are of interest; for example, structural stiffness with low mass, thermal diffusivity to reduce thermal gradients and associated distortions, and smooth surface finish to accept of optical coatings. Thermal, elastic, electrical and magnetic properties may be anisotropic, thus crystal structure is also important.

#### 4.1 Physical Properties of Selected Metals

Metal	Symbol	Crystal structure	Space group	Atomic weight	Density (g/cm <sup>3</sup> )
Aluminum	Al	cubic	Fm3m	26.98	2.70
Beryllium	Be	hexagonal	P6 <sub>3</sub> /mmc	9.01	1.85
Chromium	Cr	cubic	Im3m	52.00	7.15
Copper	Cu	cubic	Fm3m	63.55	8.96
Germanium	Ge	cubic	Fd3m	72.61	5.32

## 4.2 Optical Properties

The following tables list the index of refraction  $n$ , the extinction coefficient  $k$ , and the normal incidence reflection  $R(\phi = 0)$  as a function of photon energy  $E$  expressed in electron volts (eV). The dielectric function  $\epsilon = \epsilon_1 + i\epsilon_2$  can be computed from the complex index of refraction  $N = n + ik$  using  $\epsilon_1 = n^2 - k^2$  and  $\epsilon_2 = 2nk$ .

The tables are from Weaver, J. H. and Frederikse, H. P. R., Optical properties of selected elements, in *CRC Handbook of Chemistry and Physics*, 82nd edition, Lide, D. R., Ed. (CRC Press, Boca Raton, FL, 2001), p. 12-133. The optical constants in these tables are abridged from three more extensive tabulations.<sup>1-3</sup> For critical applications the reader should refer to the original work. References for individual metals are listed at the end of the tables. Generally tabulated values for the optical properties are accurate to better than 10%. Data in parentheses are extrapolated or interpolated values. For most elements the spectral range covered is from the far infrared (0.010 or 0.10 eV) to the far ultraviolet (10, 30, or 300 eV). The intervals between successive energies in the tables are chosen in such a way that the major spectral features are preserved.

Tables of  $n$ ,  $k$ , and  $R(\phi = 0)$  are given for the following metals:

Aluminum	Iron	Palladium	Tantalum
Chromium	Magnesium	Platinum	Titanium
Copper	Molybdenum	Rhenium	Tungsten
Germanium	Nickel	Rhodium	Zinc
Gold	Niobium	Silicon	Zirconium
Iridium	Osmium	Silver

**Spectra**

Spectra of n and k and of the normal incidence absorptance A and reflectance R are shown graphically in Figures 4.2.1–4.2.24 for the following metals [figures are from Lynch, D. W., Mirror and reflector materials, *Handbook of Laser Science and Technology, Vol. IV, Optical Materials, Part 2* (CRC Press, Boca Raton, FL, 1986), p. 185].

Aluminum	Gold	Nickel	Silicon
Copper	Iron	Niobium	Silver
Germanium	Molybdenum	Platinum	Tungsten

Figure 4.2.1 Real ( $n$ ) and imaginary ( $k$ ) part of the index of refraction for aluminum.

Figure 4.2.2 Reflectance and absorptance ( $A$ ) for aluminum calculated for normal incidence from the data of [Figure 4.2.1](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.3 Real (n) and imaginary (k) part of the index of refraction for copper.

Figure 4.2.4 Reflectance and absorptance (A) for copper calculated for normal incidence from the data of [Figure 4.2.3](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.5 Real (n) and imaginary (k) part of the index of refraction for germanium.

Figure 4.2.6 Reflectance (R) for germanium calculated for normal incidence from the data of Figure 4.2.4. Germanium is transparent for wavelengths  $>1.8\text{ }\mu\text{m}$  and no effect from a second surface has been considered in calculating R.

Figure 4.2.7 Real (n) and imaginary (k) part of the index of refraction for gold.

Figure 4.2.8 Reflectance and absorptance (A) for gold calculated for normal incidence from the data of Figure 4.2.7. Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.9 Real (n) and imaginary (k) part of the index of refraction for iron.

Figure 4.2.10 Reflectance and absorptance (A) for iron calculated for normal incidence from the data of Figure 4.2.9. Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.11 Real (n) and imaginary (k) part of the index of refraction for molybdenum.

Figure 4.2.12 Reflectance and absorptance (A) for molybdenum calculated for normal incidence from the data of [Figure 4.2.11](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.13 Real (n) and imaginary (k) part of the index of refraction for nickel.

Figure 4.2.14 Reflectance and absorptance (A) for nickel calculated for normal incidence from the data of [Figure 4.2.13](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.15 Real (n) and imaginary (k) part of the index of refraction for niobium.

Figure 4.2.16 Reflectance and absorptance (A) for niobium calculated for normal incidence from the data of [Figure 4.2.15](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.17 Real ( $n$ ) and imaginary ( $k$ ) part of the index of refraction for platinum.

Figure 4.2.18 Reflectance and absorptance ( $A$ ) for platinum calculated for normal incidence from the data of [Figure 4.2.17](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.19 Real (n) and imaginary (k) part of the index of refraction for silicon.

Figure 4.2.20 Reflectance and absorptance (A) for silicon calculated for normal incidence from the data of [Figure 4.2.19](#). Silicon is transparent for wavelengths  $> 1.2 \mu\text{m}$  and no effect from a second surface has been considered in calculating R.

Figure 4.2.21 Real (n) and imaginary (k) part of the index of refraction for silver.

Figure 4.2.22 Reflectance and absorptance (A) for silver calculated for normal incidence from the data of [Figure 4.2.21](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

Figure 4.2.23 Real ( $n$ ) and imaginary ( $k$ ) part of the index of refraction for tungsten.

Figure 4.2.24 Reflectance and absorptance ( $A$ ) for tungsten calculated for normal incidence from the data of [Figure 4.2.23](#). Note that  $A = 1 - R$  and a semi-infinite sample is assumed, i.e., the sample is thick enough to be opaque.

**Emittance**

Emittance is the ratio of radiated emitted power of a surface (W/m<sup>2</sup>) to the emissive power of a blackbody at the same temperature. The total emittance is an integral over all wavelengths; the spectral emittance is given as a function of wavelength at constant temperature.

Normal Spectral Emittance (650 nm)	
Metal	Emissivity
Beryllium	0.61
Chromium	0.34
Copper	0.10
Gold	0.14
Iron	0.35
Iron (cast)	0.37
Molybdenum	0.37
Nickel	0.36
Nickel (80) -chromium (20)	0.35
Palladium	0.33
Platinum	0.30
Silver	0.07
Steel	0.35
Tantalum	0.49
Titanium	0.63
Tungsten	0.43
Zirconium	0.32

From the *CRC Handbook of Chemistry and Physics*,  
75th edition, Lide, D. R., Ed. (CRC Press, Boca  
Raton, FL, 1994), p. 10-296.

Total Emittance		
Metal	Temperature (°C)	Emissivity
Aluminum		
polished	50–500	0.04–0.06
oxidized	200	0.11
	600	0.19
Chromium

## *Section 5: Liquids*

- 5.1 Introduction
- 5.2 Water
- 5.3 Physical Properties of Selected Liquids
- 5.4 Index of Refraction
- 5.5 Nonlinear Optical Properties
- 5.6 Magneto optic Properties
- 5.7 Commercial Optical Liquids

## Section 5

### LIQUIDS

#### 5.1 Introduction

Liquids in this section include water (H<sub>2</sub>O), heavy water (D<sub>2</sub>O), and the following selected organic materials (CAS – Chemical Abstract Service Registry Number):

CAS no.	Liquid	CAS no.	Liquid
100	acetic acid, C <sub>2</sub> H <sub>4</sub> O <sub>2</sub>	5672	ethanol, C <sub>2</sub> H <sub>6</sub> O
10411	acetone, C <sub>3</sub> H <sub>6</sub> O	5569	ethylene glycol, C <sub>2</sub> H <sub>6</sub> O <sub>2</sub>
867	benzene, C <sub>6</sub> H <sub>6</sub>	10186	glycerine (glycerol), C <sub>3</sub> H <sub>8</sub> O <sub>3</sub>
998	bromobenzene, C <sub>6</sub> H <sub>5</sub> Br	6355	heptane, C <sub>7</sub> H <sub>16</sub>
3993	carbon disulfide, CS <sub>2</sub>	6632	hexadecane, C <sub>16</sub> H <sub>34</sub>
7540	carbon tetrachloride, CCl <sub>4</sub>	6731	hexane, C <sub>6</sub> H <sub>14</sub>
7554	chloroform, CHCl <sub>3</sub>	7581	methanol, CH <sub>4</sub> O
4305	cyclohexane, C <sub>6</sub> H <sub>12</sub>	4426	methylcyclohexane, C <sub>7</sub> H <sub>14</sub>
5529	1,2-dichloroethane, C <sub>2</sub> H <sub>4</sub> Cl <sub>2</sub>	7915	1-methylnaphthalene, C <sub>11</sub> H <sub>10</sub>
7499	dichloromethane, CH <sub>2</sub> Cl <sub>2</sub>	2049	nitrobenzene, C <sub>6</sub> H <sub>5</sub> NO <sub>2</sub>
7529	dimethylsulfoxide, C <sub>2</sub> H <sub>6</sub> OS	1947	toluene, C <sub>7</sub> H <sub>8</sub>
5187	1,4-dioxane, C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>	8848	2,2,4-trimethylpentane, C <sub>8</sub> H <sub>18</sub>

#### 5.2 Water

##### 5.2.1 Physical Properties

Density, specific heat capacity at constant pressure (C<sub>p</sub>), viscosity, vapor pressure, thermal conductivity, dielectric constant, and surface tension of water. All values (except vapor pressure) at for a pressure of 100 kPa (1 bar). Temperature scale is IPTS-68.

Temp. (°C)	Density (g/cm <sup>3</sup> )	C <sub>p</sub> (J/g K)	Visc. (μPa s)	Vapor press. (kPa)	Therm. cond. (mW/m K)	Diel. const.	Surf. tens. (mN/m)
0	0.99984	4.2176	0.6113	1793	561.0	87.90	75.64

#### 5.3.1 Thermal conductivity

Thermal conductivity values correspond to a nominal pressure of 1 atmosphere. The values for water, benzene, and toluene are particularly well determined and can be used for calibration purposes.

Liquid	Thermal conductivity (W/m K)					
	−25°C	0°C	25°C	50°C	75°C	100°C
acetic acid, $\text{C}_2\text{H}_4\text{O}_2$			0.158	0.153	0.149	0.144
acetone, $\text{C}_3\text{H}_6\text{O}$		0.169	0.161			
benzene, $\text{C}_6\text{H}_6$			0.1411	0.1329	0.1247

water, H <sub>2</sub> O		0.5610	0.6071	0.6435	0.6668	0.6791

From the table in *CRC Handbook of Chemistry and Physics*, 75th edition, Lide, D. R., Ed. (CRC Press, Boca Raton, FL, 1994), p. 6–249. Thermal conductivity data for additional organic and inorganic liquids are given in this reference.

### 5.3.2 Viscosity

Liquid	Viscosity (mPa s)					
	–25°C	0°C	25°C	50°C	75°C	100°C
acetic acid, C <sub>2</sub> H <sub>4</sub> O <sub>2</sub>			1.056	0.786	0.599	0.464
acetone, C <sub>3</sub> H <sub>6</sub> O	0.540	0.395	0.306	0.247		
benzene, C <sub>6</sub> H <sub>6</sub>		0.604	0.436	0.335		
bromobenzene, C <sub>6</sub> H <sub>5</sub> Br			10.74	0.798	0.627	0.512
carbon disulfide, CS <sub>2</sub>		0.429	0.352			
carbon tetrachloride, CCl <sub>4</sub>		1.0321	0.908	0.656	0.494	
chloroform, CHCl <sub>3</sub>	0.988	0.706	0.537	0.427		
cyclohexane, C <sub>6</sub> H <sub>12</sub>			0.894	0.615	0.447	
1,2-dichloroethane, C <sub>2</sub> H <sub>4</sub> Cl <sub>2</sub>			0.464	0.362		
dichloromethane, CH <sub>2</sub> Cl <sub>2</sub>	0.727	0.533	0.413			
dimethylsulfoxide, C <sub>2</sub> H <sub>6</sub> OS			1.987	1.290		
1,4-dioxane, C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>			1.177	0.787	0.569	
ethanol, C <sub>2</sub> H <sub>6</sub> O	3.262	1.786	1.074	0.694	0.476	
ethylene glycol, C <sub>2</sub> H <sub>6</sub> O <sub>2</sub>			16.1	6.554	3.340	1.975
glycerine (glycerol), C <sub>3</sub> H <sub>8</sub> O <sub>3</sub>			934	152	39.8	14.8
heptane, C <sub>7</sub> H <sub>16</sub>	0.757	0.523	0.378	0.301	0.243	
hexadecane, C <sub>16</sub> H <sub>34</sub>				2.487	1.609	1.132
hexane, C <sub>6</sub> H <sub>14</sub>		0.405	0.300	0.240		
methanol, CH <sub>4</sub> O	1.258	0.793	0.544			
methylcyclohexane, C <sub>7</sub> H <sub>14</sub>		0.991	0.679	0.501	0.390	0.316
nitrobenzene, C <sub>6</sub> H <sub>5</sub> NO <sub>2</sub>		3.036	1.863	1.262	0.918	0.704
toluene, C <sub>7</sub> H <sub>8</sub>	1.165	0.778	0.560	0.424	0.333	0.270
water, H <sub>2</sub> O		1.793	0.890	0.547	0.378	0.282

Viscosity values correspond to a nominal pressure of 1 atmosphere.

### 5.3.3 Surface Tension

Liquid	Surface tension $\sigma$ (mN/m)				
	10°C	25°C	50°C	75°C	100°C
acetic acid, C <sub>2</sub> H <sub>4</sub> O <sub>2</sub>		27.10	24.61	22.13	
acetone, C <sub>3</sub> H <sub>6</sub> O		23.46	20.66		
benzene, C <sub>6</sub> H <sub>6</sub>		28.22	25.00	21.77	
bromobenzene, C <sub>6</sub> H <sub>5</sub> Br	36.98	35.24	32.34	29.44	26.54
carbon disulfide, CS <sub>2</sub>	33.81	31.58	27.87		
carbon tetrachloride, CCl <sub>4</sub>		26.43	23.37	20.31	17.25
chloroform, CHCl <sub>3</sub>		26.67	23.44	20.20	
cyclohexane, C <sub>6</sub> H <sub>12</sub>	26.43	24.65	21.68		
1,2-dichloroethane, C <sub>2</sub> H <sub>4</sub> Cl <sub>2</sub>		31.86	28.29	24.72	
dichloromethane, CH <sub>2</sub> Cl <sub>2</sub>		27.20			
dimethylsulfoxide, C <sub>2</sub> H <sub>6</sub> OS		42.92	40.06		
1,4-dioxane, C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>		32.75	29.28	25.80	22.32
ethanol, C <sub>2</sub> H <sub>6</sub> O	23.22	21.97	19.89		
ethylene glycol, C <sub>2</sub> H <sub>6</sub> O <sub>2</sub>		47.99	45.76	43.54	41.31
heptane, C <sub>7</sub> H <sub>16</sub>	21.12	19.65	17.20	14.75	
hexadecane, C <sub>16</sub> H <sub>34</sub>		27.05	24.91	22.78	20.64
hexane, C <sub>6</sub> H <sub>14</sub>	19.42	17.89	15.33		
methanol, CH <sub>4</sub> O	23.23	22.07	20.14		
methylcyclohexane, C <sub>7</sub> H <sub>14</sub>	24.989	23.29	20.46		
nitrobenzene, C <sub>6</sub> H <sub>5</sub> NO <sub>2</sub>			40.56	37.66	34.77
toluene, C <sub>7</sub> H <sub>8</sub>	29.71	27.93	24.96	21.98	19.01
water, H <sub>2</sub> O	74.23	71.99	67.94	63.57	58.91

### 5.3.4 Absorption

#### Ultraviolet Absorption of Pure Liquids:

The following tables present data on the UV absorption edge of several common liquids. The data were obtained using a 1.00-cm pathlength cell and a water reference. From Bruno, T. J. and Svoronos, P. D. N., *CRC Handbook of Basic Tables for Chemical Analysis* (CRC Press, Boca Raton, FL, 1989), p. 213.

Acetone	
Wavelength (nm)	Maximum absorbance
330	1.000
340	0.060
350	0.010
375	0.005
400	0.005

Benzene	
Wavelength (nm)	Maximum absorbance
278	1.000
300	0.020
325	0.010
350	0.005
400	0.005

Carbon tetrachloride	
Wavelength (nm)	Maximum absorbance
263	1.000
275	0.100
300	0.005
350	0.005
400	0.005

Cyclohexane	
Wavelength (nm)	Maximum absorbance
200	1.000
225	0.170
250	0.020
300	0.005
400	0.005

1,4-Dioxane	
Wavelength (nm)	Maximum absorbance
215	1.000
250	0.300
300	0.020
350	0.005
400	0.005

Hexane	
Wavelength (nm)	Maximum absorbance
195	1.000
225	0.050
250	0.010
275	0.005
300	0.005

Toluene	
Wavelength (nm)	Maximum absorbance
284	1.000
300	0.120
325	0.020
350	0.005
400	0.005

Chloroform	
Wavelength (nm)	Maximum absorbance
245	1.000
250	0.300
275	0.005
300	0.005
400	0.005

Dimethyl sulfoxide	
Wavelength (nm)	Maximum absorbance
268	1.000
275	0.500
300	0.200
350	0.020
400	0.005

Hexadecane	
Wavelength (nm)	Maximum absorbance
190	1.000
200	0.500
250	0.020
300	0.005
400	0.005

Methanol	
Wavelength (nm)	Maximum absorbance
205	1.000
225	0.160
250	0.020
300	0.005
400	0.005

Water	
Wavelength (nm)	Maximum absorbance
190	0.010
200	0.010
250	0.005
300	0.005
400	0.005

### Transmission Limits\*

Liquid	Limit (nm)	Liquid	Limit (nm)
acetone, C <sub>3</sub> H <sub>6</sub> O	200	heptane, C <sub>7</sub> H <sub>16</sub>	196
benzene, C <sub>6</sub> H <sub>6</sub>	270	<i>n</i> -hexane, C <sub>6</sub> H <sub>14</sub>	202
carbon tetrachloride, CCl <sub>4</sub>	2250	methanol, CH <sub>4</sub> O	183
chloroform, CHCl <sub>3</sub>	220	methylcyclohexane, C <sub>7</sub> H <sub>14</sub>	206
cyclohexane, C <sub>6</sub> H <sub>12</sub>	211	1-octene, C <sub>8</sub> H <sub>16</sub>	210
<i>n</i> -decane, C <sub>10</sub> H <sub>22</sub>	173	<i>n</i> -pentane, C <sub>5</sub> H <sub>12</sub>	205
<i>p</i> -dioxane, C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>	203	toluene, C <sub>7</sub> H <sub>8</sub>	274
ethanol, C <sub>2</sub> H <sub>6</sub> O	189	water, H <sub>2</sub> O	178

\* Transmission limits are the wavelengths of the last visible blackening on a spectrogram for reasonable exposure and development time. From Klevens, H. B. and Platt, J. R., Ultraviolet transmission limits of some liquids and solids, *J. Am. Chem. Soc.* 69, 3055 (1947).

Spectral transmission ranges of several fluids used for liquid filters. The end points are for 50% transmission through 1 mm of the liquid [from Cook, L. M. and Stokowski, S. E., Filter materials, in *Handbook of Laser Science and Technology, Volume IV: Optical Materials, Part 2* (CRC Press, Boca Raton, 1995), p. 151].

For other organic and inorganic filter solutions, see Pellicori, S. F., Transmittances of some optical materials for use between 1900 and 3400 Å, *Appl. Opt.* 3, 361 (1964); Bass, A. M., Short wavelength cut-off filters for the ultraviolet, *J. Opt. Soc. Am.* 38, 977 (1948); Ingersoll, K. A., Liquid filters for the visible and near infrared, *Appl. Opt.* 10, 2473 (1971); Ingersoll, K. A., Liquid filters for the ultraviolet, visible, and near infrared, *Appl. Opt.* 11, 2781 (1972).

## 5.4 Index of Refraction

### 5.4.1 Organic Liquids

Index of Refraction of Selected Liquids (293 K)

Liquid	$n_D$	Liquid	$n_D$
methanol, $\text{CH}_4\text{O}$	1.3288	ethylene glycol, $\text{C}_2\text{H}_6\text{O}_2$	1.4318
acetone, $\text{C}_3\text{H}_6\text{O}$	1.3588	hexadecane, $\text{C}_{16}\text{H}_{34}$	1.4345
ethanol, $\text{C}_2\text{H}_6\text{O}$	1.3611	1,2-dichloroethane, $\text{C}_2\text{H}_4\text{Cl}_2$	1.4448
acetic acid, $\text{C}_2\text{H}_4\text{O}_2$	1.3720	chloroform, $\text{CHCl}_3$	1.4459
hexane, $\text{C}_6\text{H}_{14}$	1.3749	carbon tetrachloride, $\text{CCl}_4$	1.4601
heptane, $\text{C}_7\text{H}_{16}$	1.3878	glycerine (glycerol), $\text{C}_3\text{H}_8\text{O}_3$	1.4746
2,2,4-trimethylpentane, $\text{C}_8\text{H}_{18}$	1.3915	toluene, $\text{C}_7\text{H}_8$	1.4961
dimethylsulfoxide, $\text{C}_2\text{H}_6\text{OS}$	1.4170	benzene, $\text{C}_6\text{H}_6$	1.5011
1,4-dioxane, $\text{C}_4\text{H}_8\text{O}_2$	1.4224	nitrobenzene, $\text{C}_6\text{H}_5\text{NO}_2$	1.5562
methylcyclohexane, $\text{C}_7\text{H}_{14}$	1.4231	bromobenzene, $\text{C}_6\text{H}_5\text{Br}$	1.5597
dichloromethane, $\text{CH}_2\text{Cl}_2$	1.4242	1-methylnaphthalene, $\text{C}_{11}\text{H}_{10}$	1.6170
cyclohexane, $\text{C}_6\text{H}_{12}$	1.4266	carbon disulfide, $\text{CS}_2$	1.6319

Measured at a wavelength of 589 nm (sodium D line).

Comparison of selected liquids and optical glasses in an index of refraction Abbe number plot.

## Index of Refraction n of Selected Liquids

Acetic acid <sup>1</sup>		Acetone <sup>1</sup>		Carbon tetrachloride <sup>1</sup>

### 5.4.3 Calibration Liquids

The six liquids below are available in highly pure form and their index of refraction has been accurately measured as a function of wavelength and temperature. They are therefore useful for calibration of refractometers. The estimated uncertainties in the values are:

2,2,4-Trimethylpentane	±0.00003
Hexadecane	±0.00008
<i>trans</i> -Bicyclo[4.0.0]decane	±0.00008
1-Methylnaphthalene	±0.00008
Toluene	±0.00003
Methylcyclohexane	±0.00003

Further details are given in the references below. This table is reprinted from Reference 1 by permission of the International Union of Pure and Applied Chemistry.

## 5.4.4 Abnormal Dispersion Liquids

Chromatic aberrations in complex lens systems can be corrected by combining lenses made of materials having different refractive indices and dispersions. When the partial dispersion of a material (refractive index for a pair of wavelengths) is plotted versus its Abbe number, most materials lie along a straight line, the so-called “normal” line. (Plots of relative dispersions showing the deviation of various glass types from the normal curve are included in most optical glass catalogs.) To correct for the secondary spectrum in apochromatic lens system (one corrected for three wavelengths), at least one of the materials must have an abnormal dispersion, that is, one lying off the normal line.

The wavelength dependence of the refractive index of a material can be described by the Buchdahl equation  $N(\omega) = N_0 + v_1\omega + v_2\omega^2 + \dots + v_j\omega^j$ , where  $N_0$  is the refractive index at the wavelengths  $\lambda$ ,  $v_1, v_2, \dots$  characterize the dispersion, and  $\omega$  is the chromatic coordinate  $\omega = (\lambda - \lambda_0)/[1 + 5/2(\lambda - \lambda_0)]$ . The dispersive power of a material in this model is given by

$$D(\lambda) = \delta N(\lambda) / (N_0 - 1) = \sum_{i=1}^n \eta_i \omega,$$

where  $n$  is the order of the Buchdahl dispersion equation. The dispersion coefficients  $\eta$  are defined by  $\eta_i = v_i / (N_0 - 1)$ . Below is a plot of the primary and secondary dispersion properties of 178 Schott optical glasses and 300 Cargille optical liquids (courtesy of R. D. Sigler).

## 5.5 Nonlinear Optical Properties

### Abbreviations for Materials

Abbreviations	Material
4-BCMUy	Yellow form of poly-4-BCMU
4ABP	4-Aminobiphenyl
123TB	1,2,3-Trimethyl benzene
124TB	1,2,4-Trimethyl benzene
1234TB	1,2,3,4-Tetramethyl benzene
1235TB	1,2,3,5-Tetramethyl benzene
$\alpha$ -NPA	a-NPO (2-(1-naphthyl)-5-phenyloxazole)
BBPEN	Bis[ <i>n</i> -butyl, 2-phenyl-1,2-ethenedithiolato(2-)- <i>S,S'</i> ] nickel
BEEDT	Bis(1,2-diethyl-1,2-ethenedithiolato(2-)- <i>S,S'</i> ) nickel
bis-MSB	<i>p</i> -Bis( <i>o</i> -methylstyryl)benzene
BP4B	Benzopurpurin 4B
BPDDT	<i>trans</i> -(Bis-(1-decyl-2-phenylethenedithiolato- <i>S,S'</i> ) nickel
BRD	Bacteriorhodopsin
BSQ	1,3-Bis(4'- <i>N,N</i> -dibutylamino-2'-hydroxyphenyl)-cyclobutene-2,4-dione
BTMSF	Bis (trimethylsilyl) ferocene
DCV	4- <i>N,N</i> -Diethylamino-4'- <i>b,b</i> -dicyanovinyl (azobenzene)
DEANS	4-Diethylamino-4'-nitrostilbene
DMF	Dimethylformamide
DMSM	4'-Dimethylamino- <i>N</i> -methyl-4-stilbazolium methylsulfate
DNTA	4-Nitrothenyldenyl (4'- <i>N,N</i> -dimethylaminoanilide)
DPA	Diphenyl amine
DQCI	1,3'-Diethyl 1-2,2-quinolythiacarbocyanice iodide
DR1	Disperse red 1
ISQ	1,3-Bis(3',3'-dimethyl-2'-indoleninyldenyl)-cyclobutene-2,4-dione
MDCB	<i>m</i> -Dicyanobenzene
MDNB	<i>m</i> -Dinitrobenzene
Mg:OPTAP	Magnesium octaphenyl tetraazaporphyrin
MNA	2-Methyl-4-nitroaniline
MNTPM	Zinc meso-tetra-( <i>p</i> -methoxyphenyl) tetrabenzoporphyrin
MNTPMP	Zinc meso-tetra-( <i>p</i> -methylphenyl) tetrabenzoporphyrin
MOMT	Magnesium octamethyltetrabenzoporphyrin
NFAI	5-Nitro(2-furanacroleindenyl (4'- <i>N,N</i> -dimethylaminoanilide)
NPCV	4- <i>N,N</i> -Dibutylamino-4'-( <i>b</i> -cyano- <i>b</i> -(4'-nitrophenyl) vinyl) (azobenzene)
P(4ABP)	Poly(4-amino biphenyl) with 1.5% tetrafluoroborate doping
P(DPA)	Poly(diphenyl amine) with 1.5% tetrafluoroborate doping
PBPC	Pb-phthalocyanine
PMTBQ	Nonconjugated derivative of a polythiophene
PPV	Poly ( <i>p</i> -phenylene vinylene)
PTPC	Pt-phthalocyanine
R6G	Rhodamine 6G
RB	Rhodamine B
rB	Rhodamine B

### Abbreviations for Materials—continued

Abbreviations	Material
Retinal	6- <i>s-cis</i> and completely <i>trans</i> retinal
retinal	<i>trans</i> -Retinal, malononitrile Knoevenagel adduct
Retinyl acetate	6- <i>s-cis</i> and completely <i>trans</i> retinyl 1,2-
SiNc	Silicon naphthalocyanine
SiPc	Silicon phthalocyanine
TBPP	Tetrabenzporphyrin
TCV	4- <i>N,N</i> -Diethylamino-4'-tricyanovinyl (azobenzene)
TKCPPC	Tetrakis(cumylphenoxy)phthalocyanines
TNF	2,4,7-Trinitrofluorenone
ZHDFT	Zinc hexadecafluorotetrabenzporphyrin
ZMTM	Zinc meso-tetramethyltetrabenzporphyrin
ZMTMF	Zinc meso-tetra-( <i>m</i> -fluorophenyl) tetrabenzporphyrin
ZMTP	Zinc meso-tetraphenyltetrabenzporphyrin
ZMTPDMAP	Zinc meso-tetra-( <i>p</i> -dimethylaminophenyl) tetrabenzporphyrin

### Experimental Methods

Abbreviation	Method	Ref.
AFRS	anharmonic forced Rayleigh scattering	1
AI1	attenuation vs. irradiance for a single beam	2,3
DFWM	degenerate four-wave mixing	4
ID	ionization decay	5
KE	DC Kerr effect	6
L	luminescence or fluorescence	7,8
MSI	modified Sagnac interferometry	9
OKE	optical Kerr effect	10
OL	optical limiting	11
PS	polarization spectroscopy	12
PST	power for self-trapping	13
SA	saturated absorption	14
SFL	self-focal length	15
TBC	two-beam coupling	14
TL	thermal lensing	16
TPDR	two-photon double resonance spectroscopy	17
TPIF	two-photon induced fluorescence	18
TRI	time-resolved interferometry	19

### 5.5.1 Two-Photon Absorption Cross Sections

The two-photon absorption cross section  $\sigma_2$  is related to the two-photon absorption coefficient  $\beta$  by  $\sigma_2 = (h\nu/N)\beta$ , where *N* is the number density of molecules.

Two-Photon Absorption Coefficient $\beta$				
Liquid	Wavelength (nm)	Pulse length (ns)	$\beta \times 10^{11}$ (m/W)	Ref.
benzene, C <sub>6</sub> H <sub>6</sub>	354.7	5	1.5	1
	532.1	5	$4.5 \times 10^{-5}$	1
cyclohexane, C <sub>6</sub> H <sub>12</sub>	694.3	14	1.9	2
toluene, C <sub>7</sub> H <sub>8</sub>	354.7	5	1.2	1
	532.1	5	$6.3 \times 10^{-4}$	1

The tables above are from Garito, A. F. and Kuzyk, M. G., Two-photon absorption, organic materials, *Handbook of Laser Science and Technology, Supplement 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 289.

#### Optical Kerr Constant

The laser-induced Kerr constant is given by  $B_0 = (2\pi/n\lambda_p)(\chi^{(3)}_{1212} + \chi^{(3)}_{1221})$ , where  $\lambda_p$  is the linearly polarized probe beam wavelength.

#### Optical Kerr Constants of Pure Liquids

Liquid	Wavelength (nm)	Optical Kerr constant $B_0$ ( $10^{-16} \text{ m/V}^2$ )
acetic acid	532	33.0
	694	22.9
	1064	21.5
acetone, C <sub>3</sub> H <sub>6</sub> O	694	8.2
benzene, C <sub>6</sub> H <sub>6</sub>	532	79
	694	70
	1064	51
carbon disulfide, CS <sub>2</sub>	694	470
	1064	360
carbon tetrachloride, CCl <sub>4</sub>	694	8.9
	1064	3.3
chlorobenzene, C <sub>6</sub> H <sub>5</sub> Cl	1064	89.9
chloroform, CHCl <sub>3</sub>	694	23
	1064	18

**Optical Kerr Constants of Pure Liquids—continued**

---

<sup>a</sup>These authors assume that lifetime =  $1/(\pi \times \text{linewidth})$ ; <sup>b</sup>This is the spontaneous scattering linewidth; these authors report different values for the spontaneous and stimulated scattering linewidth; <sup>c</sup>This is a theoretically calculated, not an experimental, number; <sup>d</sup>Density in amagats rather than pressure in atmospheres.

## 5.7 Commercial Optical Liquids

Cargille Refractive Index Liquids are examples of commercially available liquids having a wide range of known property values for optical applications. Specific refractive index and dispersion values are maintained by exacting quality control. These liquids are sold individually or in sets covering certain refractive index ranges at 25°C and 589.3 nm:

Series AAA	1.300–1.395
Series AA	1.400–1.458
Series A	1.460–1.640
Series B	1.642–1.700
Series M	1.705–1.800
Series H	1.81–2.00
Series EH	2.01–2.11
Series FH	2.12–2.21
Series GH	2.22–2.31

Other Cargille liquids are available with special properties of dispersion, transmittance, compatibility, fluorescence, stability, toxicity, etc. for special applications.

Whereas evaporation of a pure substance will not change the index of refraction, liquids that are mixtures of substances with different indices of refraction and different volatilities change refractive index through evaporation.

Typical optical liquids transmit well in the visible, begin to absorb in the near-UV and are characterized by a series of absorption bands from 800 to 1600 nm. Exceptions to this pattern are Cargille Laser Liquids Code 433 and Code 3421 which do not reach a UV cutoff until below 240 nm and which are highly transparent, without peaks and valleys in the IR out to 2500 nm.

The best optical liquids with refractive index above 1.810 are arsenic based, highly toxic, and corrosive (Cargille Refractive Index Liquids Series H, EH, FH, and GH).

Properties of representative Cargille optical immersion and laser liquids are given in the following three tables. For a discussion of the optical, physical, and chemical properties of liquids, see R. Sacher and W. Sacher, Optical liquids, *Handbook of Laser Science and Technology, Suppl. 2, Optical Materials* (CRC Press, Boca Raton, FL, 1995).

- 6.2 Physical Properties of Selected Gases
- 6.3 Index of Refraction
- 6.4 Nonlinear Optical Properties
- 6.5 Magneto optic Properties
- 6.6 Atomic Resonance Filters

## Section 6

### GASES

#### 6.1 Introduction

Gases included in this section:

Hydrogen, H <sub>2</sub>	<u>Noble gases</u>
Deuterium, D <sub>2</sub>	Helium, He
Nitrogen, N <sub>2</sub>	Neon, Ne
Oxygen, O <sub>2</sub>	Argon, Ar
Carbon monoxide, CO	Krypton, Kr
Carbon dioxide, CO <sub>2</sub>	Xenon, Xe
Nitrous oxide, N <sub>2</sub> O	
Nitric oxide, NO	
Methane, CH <sub>4</sub>	
Ammonia, NH <sub>3</sub>	

#### Composition of Air

Molecular weights and assumed fractional-volume composition of sea-level dry air:

Gas species	Molecular weight (kg/kmol)	Fractional volume (percent)
N <sub>2</sub>	28.0134	0.78084
O <sub>2</sub>	31.9988	0.209476
Ar	39.948	0.00934
CO <sub>2</sub>	44.00995	0.000314
Ne	20.183	0.00001818
He	4.0026	0.00000524
Kr	83.80	0.00000114
Xe	131.30	0.00000087
CH <sub>4</sub>	16.04303	0.000002
H <sub>2</sub>	2.01594	0.0000005
N <sub>2</sub> O	44.0129	0.0000005

From the "U.S. Standard Atmosphere, 1976," National Oceanic and Atmospheric Administration, National Aeronautics and Space Administration and the United States Air Force, 1976. The U.S. Standard Atmosphere, 1976, is an idealized, steady-state representation of the earth's atmosphere from the surface to 1000 km, as it is assumed to exist in a period of moderate solar activity. The air is assumed to be dry, and at heights sufficiently below 86 km, the atmosphere is assumed to be homogeneously mixed with a relative-volume composition leading to a mean molecular weight.

### Mean Free Path of Gases

Gas	Pressure 1 mm Hg (293 K)	Pressure 760 mm Hg (273 K)	Gas	Collision frequency (293 K)
Argon	$4.73 \times 10^{-5}$ m	$6.30 \times 10^{-8}$ m	Ammonia	$9150 \times 10^6$
Helium	13.32	17.4	Argon	4000
Hydrogen	8.81	11.1	Carbon monoxide	5100
Krypton	3.63	4.8	Carbon dioxide	6120
Neon	9.4	12.4	Helium	4540
Nitrogen	4.5	5.9	Hydrogen	10060
Oxygen	4.82	6.3	Nitrogen	5070
Xenon	2.62	3.5	Oxygen	4430

## 6.2 Physical Properties of Selected Gases

Values of all properties in this section are for atmospheric pressure,  $P = 101.325$  kPa.

### Physical Properties

Gas	Specific gravity ( $\text{kg/m}^3$ )	Molecular mass	Mole fraction solubility* in $\text{H}_2\text{O}$ ( $\times 10^5$ )
<i><u>Noble gases</u></i>			
He	0.17846	4.0026	0.6997
Ne	0.90035	20.180	0.8152
Ar	1.7839	39.948	2.519
Kr	3.745	83.80	4.512
Xe	5.8971	131.29	7.890
<i><u>Other gases</u></i>

Values for the permittivity (dielectric constant) and the average electric dipole polarization for ground state molecules are for 293 K.

Debye unit: 1 D =  $3.33564 \times 10^{-30}$  C m.

\* Relative to nitrogen. The dielectric strength (or breakdown voltage) of a material depends on the specimen thickness, the electrode shape, and the rate of the applied voltage increase. Values are given for standard conditions.

## 6.6 Atomic Resonance Filters

Atomic resonance filters (ARFs) are a class of filter devices that have very narrow bandwidth (~0.001 nm) and a wide field of view (180°). A cell containing atomic vapor (e.g., Rb, Cs, etc.) is placed between two narrow bandpass filters. The input filter has a peak transmission wavelength corresponding to a strong electron transition in the vapor species. Incoming light is then strongly absorbed, yielding an excited state population which decays, emitting photons of a second wavelength. The bandpass of the output filter corresponds to the emitted wavelength. Use of both ground state (passive operation) and excited state (laser-pumped operation) transitions have been reported for a variety of atomic vapors operating at a variety of wavelengths. A detailed review of the physics of ARFs is given by Gelbwachs.<sup>1</sup>

Atomic Resonance Filters				
Atomic species	Wavelength		Pump source	Ref.
	Input	Output		
Na	1480 nm	489 nm	optical	2
	2340 nm	569 nm	optical	2
	3420 nm	616 nm	optical	2
K	~10.6 $\mu$ m	497 nm	optical	3
Rb	20,487–776 nm	420 nm	diode laser	1
	459 nm	894 nm	none	4

### Atomic Resonance Filters—continued

Atomic species	Wavelength		Pump	Ref.
	Input	Output	source	
Cs <sup>a</sup>	456 nm	852 nm	none	4
	534 nm	404 nm	diode laser	5
Tl	535 nm	378 nm	photochemical	6
Mg	518 nm	384 nm	Nd:YAG	7
Ca <sup>a</sup>	423 nm	272 nm	diode laser	8

<sup>a</sup> Not experimentally verified.

An alternative atomic resonance filter design is the Faraday anomalous dispersion optical filter (FADOF).<sup>2,3</sup> An atomic vapor cell is placed in a magnetic field between crossed polarizers. The resonant Faraday effect causes polarization rotation at frequencies corresponding to atomic transitions. At other frequencies rotation is negligible. Thus, by proper adjustment of atomic vapor concentration, cell length, and magnetic field strength, ultranarrow-linewidth bandpass filters may be produced. FADOFs do not shift the output wavelength, and no response delay occurs. In principle, transmission is near unity at the center of the filter bandpass for linearly polarized incident light.

### Atomic Faraday Filter Data

Atomic species	Operating wavelength (nm)	Peak transmission (%)	Bandwidth (GHz)	Rejection ratio	Ref.
K	766, 770	71	1.6		9
Rb	780	63	1.0	10 <sup>5</sup>	9
Cs	852	82	0.6	10 <sup>5</sup>	10

The above table is from Cook, L. M., Filter materials, *Handbook of Laser Science and Technology, Suppl. 2: Optical Materials* (CRC Press, Boca Raton, FL, 1995), p. 115 (with additions).

## APPENDIX I

### Safe Handling of Optical Materials

When using any optical material—solid, liquid, or gas—it is always advisable to consult the Material Safety Data Sheet (MSDS). These informative documents prepared by the manufacturer or importer of a hazardous substance describe the physical and chemical properties of the product, are helpful in understanding potential health and physical hazards, and describe how to respond effectively to exposure situations. They include information such as hazardous ingredients, physical data of the material, fire and explosion hazard data, health hazard data, reactivity data, spill or leak procedures, special protection information, and emergency and first aid procedures.

Hazards associated with optical materials depend on how the material is used. This is particularly important in the case of liquids where properties such as viscosity, toxicity, and system compatibility may need to be considered. Within the refractive index range of 1.45 to 1.55 there are so many possible liquids that one can easily choose one with low toxicity. Outside this range of indices the choices of liquid are fewer, thus some degree of toxicity may be unavoidable and the use of ventilation, fume hoods, protective gloves, eye protection, and other protective devices may be mandatory. When working with optical liquids, it is always a good idea to wear appropriate gloves and eye protection and to work where ventilation is sufficient.

The following tables present information about the suitability of various common glove materials for handling liquids and about the flammability of selected liquids.

**Resistance to Liquids of Common Glove Materials**

Liquid	Natural rubber	Neoprene	Nitrile	Vinyl
acetic acid, $C_2H_4O_2$	excellent	excellent	excellent	excellent
acetone, $C_3H_6O$	good	good	good	fair
benzene, <sup>a</sup> $C_6H_6$	poor	fair	good	fair
carbon disulfide, $CS_2$	poor	poor	good	fair
carbon tetrachloride, <sup>a</sup> $CCl_4$	poor	fair	good	fair
cyclohexane, $C_6H_{12}$	fair	excellent	—	poor
diethyl ether, $CH_2Cl_2$	fair	good	excellent	poor
dimethylsulfoxide, <sup>b</sup> $C_2H_6OS$	—	—	—	—
ethylene glycol, $C_2H_6O_2$	good	good	excellent	excellent
glycerine (glycerol), $C_3H_8O_3$	good	good	excellent	excellent
hexane, $C_6H_{14}$	poor	excellent	—	poor
toluene, $C_7H_8$	poor	fair	good	fair

<sup>a</sup> Aromatic and halogenated hydrocarbons will attack all types of natural and synthetic glove materials.

<sup>b</sup> No data are available on the resistance to methylsulfoxide of natural rubber, neoprene, nitrile rubber, or vinyl materials; the manufacturer recommends the use of butyl rubber gloves.

## Flammability of Selected Liquids

Properties listed in the table below:

Boiling point: at a pressure of 101.325 kPa.

Flash point: minimum temperature at which the vapor pressure of the liquid is sufficient to form an ignitable mixture with air near the surface of the liquid.

Ignition temperature (also called autoignition temperature): minimum temperature required for self-sustained combustion in the absence of an external ignition source.

Both the flash point and the ignition temperature are not intrinsic properties but depend on the test conditions. Observed values may differ by several degrees and large uncertainties should be assumed.

Flammability			
Liquid	Boiling point (°C)	Flash point (°C)	Ignition temperature (°C)
acetic acid, C <sub>2</sub> H <sub>4</sub> O <sub>2</sub>	117.9	39	463
acetone, C <sub>3</sub> H <sub>6</sub> O	56	-20	465
benzene, C <sub>6</sub> H <sub>6</sub>	80.0	-11	498
carbon disulfide, CS <sub>2</sub>	46	-30	90
cyclohexane, C <sub>6</sub> H <sub>12</sub>	80.7	-20	245
1,2-dichloroethane, C <sub>2</sub> H <sub>4</sub> Cl <sub>2</sub>	83.5	13	413
dicloromethane, CH <sub>2</sub> Cl <sub>2</sub>	40	—	556
diethyl ether, C <sub>4</sub> H <sub>10</sub> O	34.5	-45	180
dimethylsulfoxide, C <sub>2</sub> H <sub>6</sub> OS	189	95	215
1,4-dioxane, C <sub>4</sub> H <sub>8</sub> O <sub>2</sub>	101.5	12	180
ethanol, C <sub>2</sub> H <sub>6</sub> O	78.2	13	363

## APPENDIX II

### Abbreviations, Acronyms, Initialisms, and Mineralogical or Common Names of Optical Materials

$\alpha$ -quartz	silicon dioxide (crystal)	$\text{SiO}_2$
$\alpha\beta$ -YAG	alphabet YAG	$\text{Y}_3\text{Al}_5\text{O}_{12}:\text{Ho}^{3+},\text{Er}^{3+},\text{Tm}^{3+}$
AANP	2-adamantylamino-5-nitropyridine	
AB5	ammonium pentaborate	$\text{NH}_4\text{B}_5\text{O}_8 \cdot 4\text{H}_2\text{O}$
ABS	acrylonitrile, butadiene, styrene terpolymer	$[\text{CH}_2\text{CH}(\text{CN})]_x-[\text{CH}_2\text{CHCHCH}_2]_y-[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)]_z$
acrylic	polymethyl methacrylate	$[\text{CH}_2\text{C}(\text{CH}_3)(\text{COOCH}_3)]_n$
ADA	ammonium dihydrogen arsenate	$\text{NH}_4\text{H}_2\text{AsO}_4$
AD*A <sup>(a)</sup>	deuterated ammonium dihydrogen arsenate	$\text{NH}_4(\text{H},\text{D})_2\text{AsO}_4$
ADC	allyl diglycol carbonate	$\text{O}(\text{CH}_2\text{CH}_2\text{OCOOCH}_2\text{CHCH}_2)_2$
ADP	ammonium dihydrogen phosphate	$\text{NH}_4\text{H}_2\text{PO}_4$
AD*P	deuterated ammonium dihydrogen phosphate	$\text{NH}_4(\text{H},\text{D})_2\text{PO}_4$
AGS	silver gallium silicate	$\text{AgGaS}_2$
AGSe	silver gallium selenide	$\text{AgGaSe}_2$
AHC	alkali halide crystal	
alexandrite	Cr-doped chrysoberyl	$\text{BeAl}_2\text{O}_4:\text{Cr}$
ALON	aluminum oxynitride	$5\text{AlN}-9\text{Al}_2\text{O}_3$
altaite	lead selenide	$\text{PbSe}$
alumina	aluminum oxide	$\text{Al}_2\text{O}_3$
AMTIR	amorphous GeAsSe (glass)	$\text{GeAsSe}$
AN	acrylonitrile	$[\text{CH}_2\text{CH}(\text{CN})]_n$
anatase	titanium dioxide	$\text{TiO}_2$
andalusite	aluminum silicate	$\text{Al}_2\text{SiO}_5$
anglesite	lead sulfate	$\text{PbSO}_4$
AODCST	alkyl-oxydicyanostyrene	
apatite	calcium phosphate plus fluorine or chlorine	$\text{Ca}_5(\text{PO}_4)_3(\text{F},\text{OH},\text{Cl})$
APDA	8-(4'-acetylphenyl)-1,4-dioxa-8-azaspiro[4,5]decane	
APO	amorphous polyolefin	$[\text{CH}_2\text{CRR}']_n$
aragonite	calcium carbonate	$\text{CaCO}_3$
ASN	strontium magnesium aluminate	$\text{SrMgAl}_{11}\text{O}_{19}$
ATCC	allythiourea cadmium chloride	
AZF	alumino-zirco-fluoride (glass)	variable compositions
$\beta''$ -alumina	beta double-prime alumina	$\text{Na}_{1+x}\text{Mg}_x\text{Al}_{11-x}\text{O}_{17}$
BANANAS	barium sodium niobate	$\text{Ba}_2\text{NaNb}_5\text{O}_{15}$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

barite	barium sulfate	BaSO <sub>4</sub>
BBB	beta barium borate	$\beta$ -BaB <sub>2</sub> O <sub>4</sub>
BBcP	2,5-bis(benzylidene) cycloheptanone	
BBO	barium metaborate	BaB <sub>2</sub> O <sub>4</sub>
BCBF	barium calcium fluoroborate	BaCaBO <sub>3</sub> F
BCT	barium calcium titanate	Ba <sub>0.77</sub> Ca <sub>0.23</sub> TiO <sub>3</sub>
BEL	lanthanum beryllate	La <sub>2</sub> Be <sub>2</sub> O <sub>5</sub>
berlinite	aluminum phosphate	AlPO <sub>4</sub>
beryl	beryllium aluminum silicate	Be <sub>3</sub> Al <sub>2</sub> (SiO <sub>3</sub> ) <sub>6</sub>
BFAP	barium fluoroapatite	Ba <sub>5</sub> (PO <sub>4</sub> ) <sub>3</sub> F
BGO	bismuth germanate	Bi <sub>12</sub> GeO <sub>20</sub>
BGO	bismuth germanium oxide	Bi <sub>4</sub> Ge <sub>3</sub> O <sub>12</sub>
BIBO	bismuth metaborate	BiB <sub>3</sub> O <sub>6</sub>
BIG	bismuth substituted iron garnet	Bi <sub>3x</sub> Y <sub>3(1-x)</sub> Fe <sub>5</sub> O <sub>12</sub>
BIGGSe	barium-indium-gallium-germanium selenide glass	variable compositions
BluB	barium lanthanum borate	Ba <sub>3</sub> La(BO <sub>3</sub> ) <sub>3</sub>
BMAG	barium magnesium germinate	Ba <sub>2</sub> MgGe <sub>2</sub> O <sub>7</sub>
BNB	m-bromonitrobenzene	Br(C <sub>6</sub> H <sub>4</sub> NO <sub>2</sub> )
BOV	barium vanadate	Ba <sub>5</sub> (VO <sub>4</sub> ) <sub>3</sub>
bromellite	beryllium oxide	BeO
bromyrite	silver bromide	AgBr
brookite	titanium dioxide	TiO <sub>2</sub>
BSG	borosilicate glass	variable compositions
BSKNN	barium strontium potassium sodium niobate	Ba <sub>2-x</sub> Sr <sub>x</sub> K <sub>1-y</sub> Na <sub>y</sub> Nb <sub>5</sub> O <sub>15</sub>
BSO	bismuth silicate	Bi <sub>12</sub> SiO <sub>20</sub>
BST	barium strontium titanate	Ba <sub>1-x</sub> Sr <sub>x</sub> TiO <sub>3</sub>
BSTN	barium strontium titanium niobate	Ba <sub>4</sub> Sr <sub>2</sub> Ti <sub>2</sub> Nb <sub>8</sub> O <sub>30</sub>
BT	barium titanate	BaTiO <sub>3</sub>
BTO	bismuth titanate	Bi <sub>12</sub> TiO <sub>20</sub>
BYF	barium yttrium fluoride	BaY <sub>2</sub> F <sub>8</sub>
BZMA	benzyl methacrylate	[CH <sub>2</sub> C(CH <sub>3</sub> )(COOCH <sub>2</sub> C <sub>6</sub> H <sub>5</sub> )] <sub>n</sub>
CAAP	calcium fluoroarsenite	Ca <sub>5</sub> (AsO <sub>4</sub> ) <sub>3</sub> F
CAB	cellulose acetate butyrate	(C <sub>6</sub> H <sub>7</sub> O <sub>2</sub> )(C <sub>2</sub> H <sub>3</sub> O <sub>2</sub> ) <sub>x</sub> (C <sub>4</sub> H <sub>7</sub> O <sub>2</sub> ) <sub>y</sub> - (OH) <sub>z</sub>
CaGB	calcium gadolinium borate	Ca <sub>3</sub> Gd <sub>2</sub> (BO <sub>3</sub> ) <sub>4</sub>
calcite	calcium carbonate	CaCO <sub>3</sub>

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

CALO	cerium aluminate	$\text{CeAlO}_3$
calomel	mercurous chloride	$\text{HgCl}$
CAMGAR	calcium magnesium garnet	$\text{CaY}_2\text{Mg}_2\text{Ge}_3\text{O}_{12}$
CAS	calcium aluminum silicate	$\text{Ca}_2\text{Al}_2\text{SiO}_7$
cassiterite	tin oxide	$\text{SnO}_2$
CAT	cadmium triallyl thiource	
CAZGAR	calcium zinc garnet	$\text{CaZn}_2\text{Y}_2\text{Ge}_3\text{O}_{12}$
CBN	cubic boron nitride	BN
CBO	cesium triborate	$\text{CsB}_3\text{O}_5$
CBS	carbon black suspension	C + liquid
CDA	cesium dihydrogen arsenate	$\text{CsH}_2\text{AsO}_4$
CD*A	deuterated cesium dihydrogen arsenate	$\text{Cs}(\text{H,D})_2\text{AsO}_4$
cerargyrite	silver chloride	$\text{AgCl}$
cerussite	lead carbonate	$\text{PbCO}_3$
CGA	cadmium germanium arsenate	$\text{CdGeAs}_2$
CGS	calcium gallium silicate	$\text{Ca}_2\text{Ga}_2\text{SiO}_7$
ChG	chalcogendie glass	variable compositions
chrysoberyl	beryllium aluminate	$\text{BeAl}_2\text{O}_4$
cinnabar	mercury sulfide	$\text{HgS}$
CIS	copper indium diselenide	$\text{CuInSe}_2$
CIGS	copper indium gallium diselenide	$\text{CuIn}_{1-x}\text{Ga}_x\text{Se}_2$
CLBO	cesium lithium triborate	$\text{CsLi}(\text{BO}_3)_3\text{O}$
CMP-M	2-cyano-3-(2-methyl phenyl)-propenoic acid methyl ester	
CMT	cadmium mercury telluride	$\text{Cd}_{1-x}\text{Hg}_x\text{Te}$
CNGG	calcium niobate gallium garnet	$\text{Ca}_3(\text{NbLiGa})_5\text{O}_{12}$
COANP	2-cyclo-octylamino-5-nitropyridine	
colquiriite	lithium calcium aluminum fluoride	$\text{LiCaAlF}_6$
corundum	aluminum oxide, alumina	$\text{Al}_2\text{O}_3$
cotunnite	lead chloride	$\text{PbCl}_2$
CPAP	calcium fluoroapatite	$\text{Ca}_5(\text{PO}_4)_3\text{F}$
CPF	calcium fluoroapatite	$\text{Ca}_5(\text{PO}_4)_3\text{F}$
CR 39	allyl diglycol carbonate	$[\text{O}(\text{CH}_2\text{CH}_2\text{OCOOCH}_2\text{CHCH}_2)_2]_n$
crystalite	silica (allotropic form)	$\text{SiO}_2$
cryolite	sodium fluoroaluminate	$\text{Na}_3\text{AlF}_6$
CS-FAP	calcium-strontium fluoroapatite	$(\text{Ca,Sr})_5(\text{PO}_4)_3\text{F}$
CTA	cesium titanyl arsenate	$\text{CsTiOAsO}_4$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

CTH:YAG	chromium-thulium-holmium doped YAG	$\text{Y}_3\text{Al}_5\text{O}_{12}:\text{Cr,Tm,Ho}$
CTP	cesium titano phosphnate	$\text{CsTiOPO}_4$
cunyte	calcium germanate	$\text{Ca}_2\text{GeO}_4$
CVAP	calcium fluorovandate	$\text{Ca}_5(\text{VO}_4)_3\text{F}$
CWO	cadmium tungstate	$\text{CdWO}_4$
CYB	calcium yttrium borate	$\text{Ca}_3\text{Y}_2(\text{BO}_3)_4$
CYS	calcium yttrium silicate oxyapatite	$\text{CaY}_4(\text{SiO}_4)_3\text{O}$
CZ	cubic zirconia	$\text{ZrO}_2$
CZT	cadmium zinc telluride	$(\text{Cd,Zn})\text{Te}$
DAN	4-( <i>N,N</i> -dimethylamino)-3-nitroacetanilide	
DANS	4-di-methylamino-4'-nitrostilbene	
DAST	dimethylamino- <i>N</i> -methyl-4-stilbazolium-tosylate	
DBNMNA	2,6-dibromo- <i>N</i> -methyl-4-nitroailne	
DCANP	2-docosylamino-5-nitropyridine	
D-CDA	deuterated cesium dihydrogen arsenate	$\text{Cs}(\text{H,D})_2\text{AsO}_4$
DCM	4-dicyanomethylene-2-methyl-6-dimethylamino-4'-nitrostyrene	
DCMNA	2-docosyl-2-methyl-4-nitroaniline	
DEANS`	4-di-ethylamino-4'-nitrostilbene	
DEANST	4-( <i>N,N</i> -diethylamino)- <i>b</i> -nitrostyrene	
diamond	carbon	C
diopside	calcium magnesium silicate	$\text{CaMgSi}_2\text{O}_6$
D-KB5	deuterated potassium pentaborate	$\text{KB}_5\text{O}_8 \cdot 4\text{D}_2\text{O}$
D-KDA	deuterated potassium dihydrogen arsenate	$\text{K}(\text{H,D})_2\text{AsO}_4$
D-KDP	deuterated potassium dihydrogen phosphate	$\text{K}(\text{H,D})_2\text{PO}_4$
D-LAP	deuterated L-arginine phosphate	$[\text{C}_6\text{H}_{7+x}\text{D}_{8-x}\text{N}_4\text{O}_2]^+ \cdot \text{H}_2\text{PO}_4 \cdot \text{H}_2\text{O}$
DMC	7-dimethylamino-4-methylcoumarin	$\text{C}_{14}\text{H}_{17}\text{NO}_2$
DMNP	3,5-dimethyl-1-(4 nitrophenylpyrrole	
DMSM	trans-4'-dimethylamino- <i>N</i> -methyl-4-stilbazolium methyl sulfate	
dolomite	calcium magnesium carbonate	$\text{CaMg}(\text{CO}_3)_2$
D-RDA	deuterated rubidium dihydrogen arsenate	$\text{Rb}(\text{H,D})_2\text{AsO}_4$
DTGS	deuterated triglycine sulfate	$[\text{N}(\text{H,D})_2\text{CH}_2\text{COOH}]_3 \cdot \text{H}_2\text{SO}_4$
ECOB	erbium calcium oxyborate	$\text{ErCa}_4(\text{BO}_3)_3\text{O}$
EDDT	ethylene diamine dextrotartrate	$\text{C}_6\text{H}_{14}\text{N}_2\text{O}_6$
elpasolite	potassium sodium aluminum fluoride	$\text{K}_2\text{NaAlF}_6$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

emerald	Cr-doped beryl	$\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{18}:\text{Cr}$
eulytite	bismuth silicate	$\text{Bi}_4\text{Si}_3\text{O}_{12}$
EVA	ethylene-vinyl acetate	$[\text{CH}_2\text{CH}_2]_x-[\text{CH}_2\text{CH}(\text{OCOCH}_3)]_y$
EYAB	erbium yttrium aluminum borate	$\text{YAl}_3(\text{BO}_3)_4:\text{Er}$
FAG	fluoroaluminate glass	variable compositions
FAP	calcium fluoroapatite	$\text{Ca}_5(\text{PO}_4)_3\text{F}$
FEP	perfluorinated ethylene propylene	
fluorapatite	calcium phosphate fluoride	$\text{Ca}_5(\text{PO}_4)_3(\text{F},\text{Cl},\text{OH})$
fluorite	calcium fluoride	$\text{CaF}_2$
forsterite	magnesium silicate	$\text{Mg}_2\text{SiO}_4$
fused quartz	silicon dioxide (amorphous) <sup>(b)</sup>	$\text{SiO}_2$
fused silica	silicon dioxide (amorphous)	$\text{SiO}_2$
GAB	gadolinium aluminate borate	$\text{GdAl}_3(\text{BO}_3)_4$
gahnite	zinc aluminate	$\text{ZnAl}_2\text{O}_4$
galena	lead sulfide	$\text{PbS}$
garnet	complex family of mineral compositions	$\text{A}_3\text{B}_2\text{C}_3\text{O}_{12}$
GASH	guanidinium aluminate sulfate hexahydrate	$(\text{CN}_3\text{H}_6)\text{Al}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$
g-C	graphite	C
gelenite	calcium aluminium silicate	$\text{Ca}_2\text{Al}_2\text{SiO}_7$
GFG	gallium fluoride garnet	$\text{Na}_3\text{Ga}_2\text{Li}_3\text{F}_{12}$
GGG	gadolinium gallium garnet	$\text{Gd}_3\text{Ga}_5\text{O}_{12}$
GIGG	gadolinium indium gallium garnet	$\text{Gd}_3\text{In}_2\text{Ga}_3\text{O}_{12}$
GLF	gadolinium lithium tetrafluoride	$\text{GdLiF}_4$
GLS	generating luminescence stekla (Russian)	laser glass
GLS	gallium lanthanum sulfide (glass)	$\sim 70\text{GaS}-30\text{La}_2\text{O}_3$
GOS	gadolinium oxysulfide	$\text{Gd}_2\text{O}_2\text{S}$
greenockite	cadmium sulfide	$\text{CdS}$
grossularite	calcium aluminum silicate garnet	$\text{Ca}_3\text{Al}_2\text{Si}_3\text{O}_{12}$
GSAG	gadolinium scandium aluminum garnet	$\text{Gd}_3\text{Sc}_2\text{Al}_3\text{O}_{12}$
GSGG	gadolinium scandium gallium garnet	$\text{Gd}_3(\text{Sc},\text{Ga})_2\text{Ga}_3\text{O}_{12}$
GSO	gadolinium orthosilicate	$\text{Gd}_2\text{SiO}_5$
GVO	gadolinium vanadate	$\text{GdVO}_4$
GYAG	gadolinium-yttrium aluminum garnet	$(\text{Gd},\text{Y})_3\text{Al}_5\text{O}_{12}$
halite	sodium chloride	$\text{NaCl}$
HAP	high-average-power (laser) glass	variable compositions
hematite	ferric oxide	$\text{Fe}_2\text{O}_3$
HMF	heavy metal fluoride (glass)	variable compositions

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

HMO	heavy metal oxide (glass)	variable compositions
HPP glass	high-peak-power (laser) glass	variable compositions
hydroxy-apatite	calcium phosphate hydroxide	$\text{Ca}_5(\text{PO}_4)_3\text{OH}$
ilmenite	iron titanate	$\text{FeTiO}_3$
iodyrite	silver iodide	$\beta\text{-AgI}$
Irtran 1	magnesium fluoride (polycrystalline)	$\text{MgF}_2$
Irtran 2	zinc sulfide (polycrystalline)	$\text{ZnS}$
Irtran 3	calcium fluoride (polycrystalline)	$\text{CaF}_2$
Irtran 4	zinc selenide (polycrystalline)	$\text{ZnSe}$
Irtran 5	magnesium oxide (polycrystalline)	$\text{MgO}$
Irtran 6	cadmium tellurite (polycrystalline)	$\text{CdTe}$
ITO	indium tin oxide	$\sim 0.9\text{In}_2\text{O}_3\text{--}0.1\text{SnO}_2$
KABO	potassium aluminum borate	$\text{K}_2\text{Al}_2\text{B}_2\text{O}_7$
KAP	potassium acid phthalate	$\text{C}_8\text{H}_5\text{O}_4\text{K}$
KB5	potassium pentaborate	$\text{KB}_5\text{O}_8 \cdot 4\text{H}_2\text{O}$
KBBF	potassium beryllium borate fluoride	$\text{KBeBO}_3\text{F}_2$
KCND	potassium cerium nitrate dihydrate	$\text{K}_2\text{Ce}(\text{NO}_3)_5 \cdot \text{H}_2\text{O}$
KDA	potassium dihydrogen arsenate	$\text{KH}_2\text{AsO}_4$
KD*A(a)	deuterated potassium dihydrogen arsenate	$\text{K}(\text{H},\text{D})_2\text{AsO}_4$
KDP	potassium dihydrogen phosphate	$\text{KH}_2\text{PO}_4$
KD*P(a)	deuterated potassium dihydrogen phosphate	$\text{K}(\text{H},\text{D})_2\text{PO}_4$
KGW	potassium gadolinium tungstate	$\text{KGd}(\text{WO}_4)_2$
KLGF	potassium lithium gadolinium fluoride	$\text{KLiGdF}_5$
KLN	potassium lithium nitrate	$\text{K}_3\text{Li}_{2-x}\text{Nb}_{5+x}\text{O}_{15+2x}$
KLND	potassium lanthanum nitrate dihydrate	$\text{K}_2\text{La}(\text{NO}_3)_5 \cdot 2\text{H}_2\text{O}$
KLTN	potassium lithium tantalate niobate	$\text{K}_{1-y}\text{Li}_y\text{Ta}_{1-x}\text{Nb}_x\text{O}_3$
KLYF	potassium lithium yttrium fluoride	$\text{KLiYF}_4$
KN	potassium niobate	$\text{KNbO}_3$
KNB	potassium niobium borate	$\text{KNbB}_2\text{O}_6$
KNLF	potassium neodymium lithium fluoride	$\text{K}_5\text{NdLi}_2\text{F}_{10}$
KNSBN	potassium sodium strontium barium niobate	$(\text{K}_x\text{Na}_{1-x})_{0.4}(\text{Sr}_y\text{Ba}_{1-y})_{0.8}\text{Nb}_2\text{O}_6$
KRS-5	thallium bromoiodide	$\text{Tl}(\text{Br}_{1-x},\text{I}_x)$
KRS-6	thallium chlorobromide	$\text{Tl}(\text{Cl}_{1-x},\text{Br}_x)$
KRTA	potassium-rubidium titanyl arsenate	$(\text{K},\text{Rb})\text{TiOAsO}_4$
KSAG	lutetium scandium aluminum garnet	$\text{Lu}_3\text{Cs}_2\text{Al}_5\text{O}_{12}$
KTA	potassium titanyl arsenate	$\text{KTiOAsO}_4$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

MBANP	2-(a-methyl benzylamino)-5-nitropyridine	
MBBF	alkali metal beryllium borate fluoride	$(\text{Na},\text{K})\text{BeBO}_3\text{F}_2$
MCT	mercury cadmium telluride	$\text{HgCdTe}$
MEH-PPV	poly(2-methoxy-5-(2'-ethyl-hexyloxy)-1,4-phenylene vinylene	
Mg:LN	MgO-doped lithium niobate	$\text{Mg}:\text{LiNbO}_3$
Mg:SLN	MgO-doped stoichiometric lithium niobate	$\text{Mg}:\text{LiNbO}_3$
mica	potassium aluminosilicate	$\text{KAl}_3\text{Si}_3\text{O}_{10}(\text{OH})_2$
MMA	methylmethacrylate	$\text{CH}_2\text{C}(\text{CH}_3)(\text{COOCH}_3)$
MMONS	3-methyl-4-methoxy-4'-nitrostilbene	
MNA	2 methyl-4-nitro-aniline	$\text{CH}_3\text{NH}_2\text{NO}_2\text{C}_6\text{H}_4$
MND	4-methoxy-4'-nitro-diphenyl-diacetylene-	
MNMA	2-methyl-4-nitro- <i>N</i> -methylaniline	
MNT	4-methyl-4'-nitrolan	
monazite	rare earth phosphate	$(\text{rare earth})\text{PO}_4$
MPMMA	modified polymethylmethacrylate	
MSO	magnesium silicate	$\text{Mg}_2\text{SiO}_4$
MTTNPH	5-methylthio-thiophenecarboxaldehyde-4-nitrophenyl-hydrazone	
mullite	aluminum silicate	$\text{Al}_6\text{Si}_2\text{O}_{13}$
NAB	neodymium aluminum borate	$\text{NdAl}_3(\text{BO}_3)_4$
nantokite	copper chloride	$\text{CuCl}$
NAS	methyl methacrylate styrene copolymer	$[\text{CH}_2\text{C}(\text{CH}_3)(\text{COOCH}_3)]_x-[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)]_y$
NBD-Cl	7-chloro-4'-nitrobenzo-2-oxa-1,3-diazole	
NdPP	neodymium pentaphosphate	$\text{NdP}_5\text{O}_{14}$
NGAB	neodymium gadolinium aluminum borate	$\text{Nd}_x\text{Gd}_{1-x}\text{Al}_3(\text{BO}_3)_4$
NMBA	4-nitro-4'-methyl-benzylidene aniline	
NPP	<i>N</i> -4-nitrophenyl-( <i>L,S</i> )-prolinol	
NPP	neodymium pentaphosphate	$\text{NdP}_5\text{O}_{14}$
NPPA	<i>N</i> -(4-nitro-2-pyridinyl)-phenylalaninol	
NYAB	neodymium yttrium aluminum borate	$\text{Nd}_x\text{Y}_{1-x}\text{Al}_3(\text{BO}_3)_4$
olivine	magnesium iron silicate	$(\text{Mg},\text{Fe})_2\text{SiO}_4$
ORMOSIL	organic modified silicate	$\text{SiO}_2$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

orpiment	arsenic trisulfide	$\text{As}_2\text{S}_3$
PAMS	poly(alpha-methylstyrene)	
paratelluride	tellurium oxide	$\text{TeO}_2$
PBDG	poly(g-benzl-D-glutamate)	
PBLG	poly(g-benzl-L-glutamate)	
PBN	lead barium niobate	$\text{Pb}_{1-x}\text{Ba}_x\text{Nb}_2\text{O}_6$
PBSP	photonic band-gap structure	variable compositions
PBT	polybenzothiazole	$[\text{C}_6\text{H}_3\text{NSC}]_n$
PBZT	poly(p-phenylene benzo bis thiozole)	
PCS	plastic clad silica	
PDA	polydiacetylene	$[\text{C(R)CCC(R)}]_n$
PDBT	poly(3,4-dibutoxythiophene)	
PDHG	poly(di- <i>n</i> -hexylgermane)	
PDHS	poly(di- <i>n</i> -hexylsilane)	
PDLC	polymer dispersed liquid crystal	variable compositions
periclase	magnesium oxide	$\text{MgO}$
perovskite	calcium titanate	$\text{CaTiO}_3$
PET	pentaery-thritol	$[\text{OCH}_2\text{CH}_2\text{OCC}_6\text{H}_4\text{CO}]_n$
PGO	lean germanium oxide	$\text{Pb}_5\text{Ge}_3\text{O}_{11}$
plattnerite	lead oxide	$\text{PbO}$
PLZT	lead lanthanum zirconium titanate	$\text{PbLa}(\text{Zr},\text{Ti})\text{O}_3$
PMMA	polymethylmethacrylate	
PMPS	poly(methyl phenyl silane)	
PNP	2-( <i>N</i> -prolinol)-5-nitropyridine	
POF	plastic optical fiber	variable compositions
poly- 4BCMU	polydiacetylene poly-[5,7-dodecadiyn-2,12- diol-bis( <i>n</i> -butoxycarbonyl-methyl-urethane)]	
POM	3-methyl-4-nitropyridine-1-oxide	$\text{NO}_2 \cdot \text{CH}_3\text{NOC}_5\text{H}_4$
POMT	poly(3-octyloxy,4-methyl thiophene)	
PSC	porous silicon carbide	$\text{SiC}$
powellite	calcium molybdate	$\text{CaMoO}_4$
PPKTP	periodically poled potassium titanyl phosphate	$\text{KTiOPO}_4$
PPLN	periodically poled lithium niobate	$\text{LiNbO}_3$
PPLT	periodically poled lithium tantalate	$\text{LiTaO}_3$
PPNA	poly- <i>p</i> -nitroaniline	
PPRTA	periodically poled rubidium titanyl arsenate	$\text{RbTiOAsO}_4$
PPV	poly( <i>p</i> -phenylene vinylene)	

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

---

proustite	silver arsenic sulfide	$\text{Ag}_3\text{AsS}_3$
PrPP	praseodymium pentaphosphate	$\text{PrP}_5\text{O}_{14}$
PS	polystyrene	$[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)]_n$
PSG	porous silica glass	$\text{SiO}_2$
PSZ	partially stabilized zirconia	$\text{ZrO}_2: (\text{Mg}, \text{Ca}, \text{Y})$
PT	polythiophene	
PTB	lead tetraborate	$\text{PbB}_4\text{O}_7$
PTG	poly(3-hexylthiophene	
PTOPT	poly-[3-(4-octylphenyl)]-2,2'-bithiophene	
PTS	poly-bis-( <i>p</i> -toluene sulfonate)-2,4-hexazine -1,6-diole	
PTV	poly(2,5-thienyl vinylene)	
PU	polyurethane	$[\text{OCONHRNHCOOR}']_n$
pucherite	bismuth vanadate	$\text{BiVO}_4$
PV	polyvinylxylene	$[\text{CH}_2\text{CH}(\text{CH}_2\text{C}_6\text{H}_4\text{CH}_3)]_n$
PVA	polyvinyl alcohol	
PVF <sub>2</sub>	polyvinylidene fluoride	
PVP	polyvinyl-pyrrolidimone	
pyrite	iron sulfide	$\text{FeS}_2$
PZT	lead zirconium titanate	$\text{Pb}(\text{Zr}, \text{Ti})\text{O}_3$
QC	quantum crystallite (quantum dot)	
quartz	silicon dioxide (crystal)	$\text{SiO}_2$
RAP	rubidium acid phthalate	$\text{C}_8\text{H}_5\text{O}_4\text{Rb}$
RB5	rubidium pentaborate	$\text{RbB}_5\text{O}_8 \cdot 4\text{H}_2\text{O}$
RbAP	rubidium acid phthalate	$\text{CO}_2\text{HC}_6\text{H}_4\text{CO}_2\text{Rb}$
RDA	rubidium dihydrogen arsenate	$\text{RbH}_2\text{AsO}_4$
RD*A	deuterated rubidium dihydrogen arsenate	$\text{Rb}(\text{H}, \text{D})_2\text{AsO}_4$
RDP	rubidium dihydrogen phosphate	$\text{RbH}_2\text{PO}_4$
RD*P	deuterated rubidium dihydrogen phosphate	$\text{Rb}(\text{H}, \text{D})_2\text{PO}_4$
RGB	rubidium gadolinium bromide	$\text{RbGd}_2\text{Br}_7$
rochelle salt	sodium potassium tartrate	$\text{NaKC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$
rocksalt	sodium chloride	$\text{NaCl}$
RTA	rubidium titanyl arsenate	$\text{RbTiOAsO}_4$
RTP	rubidium titanyl phosphate	$\text{RbTiOPO}_4$
ruby	Cr-doped corundum (sapphire)	$\text{Al}_2\text{O}_3:\text{Cr}$
rutile	titanium dioxide	$\text{TiO}_2$
SAN	styrene acrylonitrile copolymer	$[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)]_x-[\text{CH}_2\text{CH}(\text{CN})]_y$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

sapphire	aluminum oxide	$\text{Al}_2\text{O}_3$
sapphire	aluminum oxide (gemstone)	$\text{Al}_2\text{O}_3\text{:Ti,Fe}$
SBA	sodium- $\beta$ " alumina	$\text{Na}_{1+x}\text{Mg}_x\text{Al}_{11-x}\text{O}_{17}$
SBBO	strontium beryllium borate	$\text{Sr}_2\text{Be}_2\text{B}_2\text{O}_7$
SBN	strontium barium niobate	$\text{Sr}_{1-x}\text{Ba}_x\text{Nb}_2\text{O}_6$
SCAB	scandium aluminum beryllate	$\text{ScAlBeO}_4$
scheelite	calcium tungstate	$\text{CaWO}_4$
SDG	semiconductor-doped glass	variable compositions
sellaite	magnesium fluoride	$\text{MGF}_2$
S–FAP	strontium fluoroapatite	$\text{Sr}_5(\text{PO}_4)_3\text{F}$
SGGM	strontium gadolinium gallium melilite	$\text{SrGdGaO}_7$
silica	silicon dioxide	$\text{SiO}_2$
SIMOX	separation by implanatation of oxygen (silicon-on-insulator material)	
SLG	strontium lanthanum gallate	$\text{SrLaGa}_3\text{O}_7$
SMA	polystyrene co-maleic anhydride	$[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)\text{CH}(\text{COOCO})\text{CH}]_n$
SMMA	polystyrene co-methyl methacrylate	$[\text{CH}_2\text{C}(\text{CH}_3)(\text{COOCH}_3)]_x-$ $[\text{CH}_2\text{CH}(\text{C}_6\text{H}_5)]_y$
SNA	strontium aluminate	$\text{SrAl}_{12}\text{O}_{19}$
SOAP	calcium silico-oxyapatite	$\text{CaY}_4(\text{SiO}_4)_3\text{O}$
SOI	silicon-on-insulator (material)	
SOS	silicon (Si) epitaxial film on sapphire substrate	$\text{Si}/\text{Al}_2\text{O}_3$
SPAP	strontium fluoroapatite	$\text{Sr}_5(\text{PO}_4)_3\text{F}$
SPF	strontium fluoroapatite	$\text{Sr}_5(\text{PO}_4)_3\text{F}$
spodumene	lithium aluminum silicate	$\text{LiAlSi}_2\text{O}_6$
sphalerite	zinc sulfide (cubic)	$\text{ZnS}$
STRAP	strontium fluoroapatite	$\text{Sr}_5(\text{PO}_4)_3\text{F}$
sphalerite	zinc sulfide	$\text{ZnS}$
spinel	magnesium aluminate	$\text{MgAl}_2\text{O}_4$
spodumene	lithium aluminum silicate	$\text{LiAlSi}_2\text{O}_6$
SrYBO	strontium yttrium borate	$\text{Sr}_3\text{Y}(\text{BO}_3)_3$
styrene	polystyrene	
STZO	strontium titanate zirconate	$\sim 0.8\text{SrTiO}_3-0.2\text{ZrO}_2$
S-VAP	strontium vanadium fluoroapatite	$\text{Sr}_5(\text{VO}_4)_3\text{F}$
sylvite	potassium chloride	$\text{KCl}$
SYS	strontium yttrium silicate oxyapatite	$\text{SrY}_4(\text{SiO}_4)_3\text{O}$
T-12	barium fluoride-calcium fluoride	$\text{BaF}_2\text{-CaF}_2$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

TAS	thallium arsenic selenide	$\text{Ti}_3\text{AsSe}_3$
TBPc	tetrakis (tert-butyl) phthalocyanine	
TCDMA	tricyclodecyl co-methacrylate	$[\text{CH}_2\text{C}(\text{CH}_3)(\text{COOC}_{10}\text{H}_{15})]_n$
TCO	transparent conductive oxide	e.g., ITO
TCNQ	7,7,8,8-tetracyanoquinodimethane	
TEOS	tetraethyl orthosilicate	$(\text{C}_2\text{H}_5\text{O})_4\text{Si}$
TeX	tellurium halide glass	variable composition
TGG	terbium gallium garnet	$\text{Tb}_3\text{Ga}_5\text{O}_{12}$
TGS	triglycine sulfate	$(\text{NH}_2\text{CH}_2\text{COOH})_3 \cdot \text{H}_2\text{SO}_4$
TGSe	triglycine selenate	
THAM-P	tris-hydroxylmethylaminomethane-phosphate	
THAM-S	tris-hydroxylmethylaminomethane-sulfate	
TiOPc	titanyl phthalocyanine	
Ti:S	Ti-doped corundum/alumina	$\text{Al}_2\text{O}_3:\text{Ti}$
Ti sapphire	Ti-doped corundum/alumina	$\text{Al}_2\text{O}_3:\text{Ti}$
TIAP	thallium acid phthalate	$\text{C}_8\text{H}_5\text{O}_4\text{Tl}$
TMOS	tetramethyloxysilane	$\text{Si}(\text{OCH}_3)_4$
TOC	transparent optical ceramic	various compositions
topaz	aluminum silicate fluoride hydroxide	$\text{Al}_2\text{SiO}_4(\text{F},\text{OH})_2$
tourmaline	sodium aluminum borosilicate	$\text{Na}_3\text{Al}_6\text{Si}_6\text{O}_{18}(\text{BO}_3)_2(\text{OH},\text{F})_4$
TPX	methyl pentene polymer	
tridymite	silicon dioxide	$\text{SiO}_2$
TSCCC	thiosemicarbazide cadmium chloride monohydrate	
tysonite	lanthanum trifluoride	$\text{LaF}_3$
urea	urea crystal	$\text{CH}_4\text{N}_2\text{O}$
VAC	vinyl acetate	$[\text{CH}_2\text{CH}(\text{OCOCH}_3)]_n$
VB	vinyl benzoate	
villiaumite	sodium fluoride	$\text{NaF}$
VOPc	vanadyl phthalocyanine	
VPAC	vinyl phenyl acetate	$[\text{CH}_2\text{CH}(\text{OCOC}_6\text{H}_5)]_n$
VTE LN	vapor-transport-equilibrated lithium niobate	$\text{LiNbO}_3$
weberite	sodium magnesium aluminum fluoride	$\text{NaMgAlF}_7$
willemite	zinc silicate	$\text{ZnSiO}_4$
wollastonite	calcium silicate	$\text{CaSiO}_3$
wulfenite	lead molybdate	$\text{PbMoO}_4$
wurtzite	zinc sulfide (hexagonal)	$\text{ZnS}$

**Abbreviations, Acronyms, Initialisms, and Mineralogical  
or Common Names of Optical Materials—*continued***

xenotime	yttrium phosphate	YPO <sub>4</sub>
YAB	yttrium aluminum borate	YAl <sub>3</sub> (BO <sub>3</sub> ) <sub>4</sub>
YAG	yttrium aluminum garnet <sup>(c)</sup>	Y <sub>3</sub> Al <sub>5</sub> O <sub>12</sub>
YAlG	yttrium aluminum garnet	Y <sub>3</sub> Al <sub>5</sub> O <sub>12</sub>
valliaumite	sodium fluoride	NaF
yablonovite	photonic bandgap crystal	variant of the diamond structure
YAlO	yttrium orthoaluminate	YAlO <sub>3</sub>
YAP	yttrium aluminum perovskite	YAlO <sub>3</sub>
YAM	yttrium aluminum monoclinic	Y <sub>4</sub> Al <sub>2</sub> O <sub>9</sub>
YBF	yttrium barium fluoride	Y <sub>2</sub> BaF <sub>8</sub>
YGG	yttrium gallium garnet	Y <sub>3</sub> Ga <sub>5</sub> O <sub>12</sub>
YGO	yttrium gadolinium oxide	(Y,Gd) <sub>2</sub> O <sub>3</sub>
YGOB	yttrium gadolinium borate	CaY <sub>4</sub> (BO <sub>3</sub> ) <sub>3</sub> O
YIG	yttrium iron garnet	Y <sub>3</sub> Fe <sub>5</sub> O <sub>12</sub>
YIGG	yttrium indium gallium gadolinium garnet	Y <sub>3</sub> (In,Ga) <sub>2</sub> Gd <sub>3</sub> O <sub>12</sub>
YLF	yttrium lithium fluoride	YLiF <sub>4</sub> (LiYF <sub>4</sub> )
YOP	yttrium orthophosphate	YPO <sub>4</sub>
YOS	yttrium orthosilicate	Y <sub>2</sub> SiO <sub>5</sub>
YSAG	yttrium scandium aluminum garnet	Y <sub>3</sub> Sc <sub>2</sub> Al <sub>3</sub> O <sub>12</sub>
YSB	yttrium scandium borate	YSc <sub>3</sub> (BO <sub>3</sub> ) <sub>4</sub>
YSGG	yttrium scandium gallium garnet	Y <sub>3</sub> Sc <sub>2</sub> Ga <sub>3</sub> O <sub>12</sub>
YSO	yttrium silicon oxide (orthosilicate)	Y <sub>2</sub> SiO <sub>5</sub>
YSZ	yttria stabilized zirconia	ZrO <sub>2</sub> :Y <sub>2</sub> O <sub>3</sub>
yttralox	yttrium oxide (polycrystalline)	Y <sub>2</sub> O <sub>3</sub>
Zerodur	glass ceramic	SiO <sub>2</sub> –Al <sub>2</sub> O <sub>3</sub> + . . .
zinc blende	zinc sulfide (cubic)	ZnS
zincite	zinc oxide	ZnO
ZTS	zinc tris(thiourea) sulfate	Zn[CS(NH <sub>2</sub> ) <sub>2</sub> ] <sub>3</sub> SO <sub>4</sub>
zircon	zirconium silicate	ZrSiO <sub>4</sub>
zirconia	zirconium dioxide	ZrO <sub>2</sub>

---

(a) When crystals are grown in heavy water (D<sub>2</sub>O) solution, hydrogen is replaced in part or totally by deuterium. Such crystals are designated by a prefix d- or D-, or by an asterisk, e.g., d-CDA and CD\*A.

(b) Produced from natural quartz.

(c) Nd-doped YAG lasers are frequently simply called YAG lasers.

## APPENDIX III

### Abbreviations for Methods of Preparing Optical Materials and Thin Films

---

ACR	—	accelerated crucible rotation (flux growth)
ACRT	—	accelerated crucible rotation technique
ALE	—	atomic layer epitaxy
ALL MBE	—	atomic layer-by-layer molecular beam epitaxy
APCVD	—	accelerated plasma chemical vapor deposition
APD	—	accelerated plasma deposition
APE	—	annealed proton exchange
ARE	—	activated reactive evaporation
BARE	—	biased activated reactive evaporation
BE	—	bond and etch (waveguide structure)
Br	—	Bridgman (growth)
CAIBE	—	chemically-assisted ion beam epitaxy
CAMBE	—	chemically-assisted molecular beam epitaxy
CBE	—	chemical beam epitaxy
CLD	—	chemical liquid deposition
CVD	—	chemical vapor deposition
CVT	—	chemical vapor transport
Cz	—	Czochralski (growth)
DIBD	—	dual ion beam deposition
DIBS	—	dual ion beam sputtering
DMILC	—	double-metal-induced lateral crystallization
DWB	—	direct wafer bonding (waveguide structure)
ED	—	electrodeposition
EDFF	—	edge-defined film-fed (growth)
EFG	—	edge-defined film-fed growth
FHD	—	flame hydrolysis deposition
FIB	—	focused ion beam (sputtering)
FICZ	—	flat interface Czochralski (growth)
FZ	—	float zone
GD	—	glow discharge
GILD	—	gas immersion laser doping
GS-MBE	—	gas-source molecular beam epitaxy
HBr	—	horizontal Bridgman (growth)
HCD	—	hollow cathode discharge deposition
HEM	—	heat exchange method
HGF	—	horizontal gradient freeze
HIP	—	hot isostatic pressing
HPBr	—	high-pressure Bridgman (growth)
HPVB	—	high-pressure vertical Bridgman

## Abbreviations for Methods of Preparing Optical Materials and Thin Films—*continued*

---

HTS	—	high temperature solution
HTSG	—	high temperature solution growth
HVPE		hydride vapor-phase epitaxy
IAD	—	ion assisted deposition
IAD	—	ion beam assisted deposition
IBD	—	ion beam deposition
IBE	—	ion beam etching
IBED	—	ion beam enhanced deposition
IBS	—	ion beam sputtering
ICB	—	ion cluster beam
ICBD	—	ionized cluster beam deposition
ISZ-THM	—	increasing solution zone travelling heater method
IVD	—	inside vapor deposition
IVDO	—	inside vapor deposition oxidation
JVD	—	jet vapor deposition
LAD	—	laser aerosol deposition
LAD	—	laser-assisted deposition
LB	—	Langmuir-Blodgett (film technique)
LBD	—	Langmuir-Blodgett deposition
LCVD	—	laser-induced chemical vapor deposition
LEC	—	liquid-encapsulated Czochralski (growth)
LECVD	—	liquid-encapsulated chemical vapor deposition
LEVGF	—	liquid-encapsulated vertical gradient freeze
LHPG	—	laser heated pedestal growth
LPCVD	—	liquid-phase chemical vapor deposition
LPCVD	—	low-pressure chemical vapor deposition
LPE	—	liquid phase epitaxy
LP-MOVPE	—	low-pressure metal-organic vapor-phase epitaxy
LTE	—	local thermal equilibrium
LTGCz	—	low-thermal gradient Czochralski (growth)
LT-MBE	—	low-temperature molecular beam epitaxy
LVRIP	—	low-voltage reactive ion plating
MBD	—	molecular beam deposition
MBE	—	molecular beam epitaxy
MCVD	—	modified chemical vapor deposition
MIC	—	metal-induced crystallization
MILC	—	metal-induced lateral crystallization
MOCVD	—	metal-organic chemical vapor deposition
MOMBE	—	metal-organic molecular beam epitaxy
MOVD	—	modified vapor deposition
MOVPE	—	metal-organic vapor-phase epitaxy

## Abbreviations for Methods of Preparing Optical Materials and Thin Films—*continued*

---

MPD	—	microwave plasma deposition
NSP	—	neutral solution processing
OMCVD	—	organometallic chemical vapor deposition
OMMBE	—	organometallic molecular beam epitaxy
OMVPE	—	organometallic vapor-phase epitaxy
OVD	—	outside vapor deposition
OVPO	—	outside vapor phase
PCVD	—	plasma chemical vapor deposition
PACVD	—	plasma-assisted chemical vapor deposition
PAE	—	plasma assisted epitaxy
PCVD	—	plasma chemical vapor deposition
PE	—	plasma etching
PECVD	—	plasma-enhanced chemical vapor deposition
PIBD	—	primary ion beam deposition
PICVD	—	plasma ionization chemical vapor deposition
PLD	—	physical liquid deposition
PLD	—	pulsed laser deposition
PVD	—	physical vapor deposition
PVT	—	physical vapor transport
RAP	—	reactive atmosphere processing
RE	—	reactive evaporation
RIBE	—	reactive ion beam etching
RICBD	—	reactive ionized cluster beam deposition
RIE	—	reactive ion etching
RS	—	reactive sputtering
SAM	—	self-assembled monolayer
SIBD	—	secondary ion beam deposition
SOL GEL	—	solution gelation (processing)
SPCVD	—	surface-plasma chemical vapor deposition
SPE	—	solid phase epitaxy
SPVT	—	seeded physical vapor transport
SSE	—	solid-state epitaxy
SSMOCVD	—	solid source metal-organic chemical vapor deposition
SSVG	—	self-selected vapor growth
St	—	Stockbarger (growth)
TGZM	—	temperature-gradient zone melting
THM	—	travelling heater method
TNFC	—	top nucleated floating crystal (growth)
TSFZ	—	travelling solvent float zone
TSM	—	travelling solvent method
TSSG	—	top-seeded solution growth

**Abbreviations for Methods of Preparing  
Optical Materials and Thin Films—*continued***

---

UHV-CVD	—	ultra-high-vacuum chemical vapor deposition
VAD	—	vapor-phase axial deposition
VBr	—	vertical Bridgman (growth)
VD	—	vacuum deposition
VGd	—	vapor gel deposition
VGf	—	vertical gradient freeze
VLPC	—	very-low-pressure chemical
VD	—	vapor deposition
VLS	—	vapor-liquid-solid
VMS	—	vapor melt solid
VPE	—	vapor-phase epitaxy
VPg	—	vapor-phase growth
VPO	—	vapor-phase oxidation
VT	—	vapor transport
VTE	—	vapor transport equilibrated
ZM	—	zone melted
ZMR	—	zone melting recrystallization

---

## APPENDIX IV

### Fundamental Physical Constants

Quantity	Symbol	Value
speed of light in vacuum	$c$	299 792 458 m/s
permeability of vacuum, $4\pi \times 10^{-7}$	$\mu_0$	$1.256\,637\,061\,4 \times 10^{-6} \text{ N/A}^2$
permittivity of vacuum, $1/\mu_0 c^2$	$\epsilon_0$	$8.854\,187\,817 \times 10^{-12} \text{ F/m}$
Planck constant	$h$	$6.626\,075\,5 \times 10^{-34} \text{ J s}$
elementary charge	$e$	$1.602\,177\,33 \times 10^{-19} \text{ C}$
magnetic flux quantum, $h/2e$	$\Phi_0$	$2.067\,834\,61 \times 10^{-15} \text{ Wb}$
electron mass	$m_e$	$9.109\,389\,7 \times 10^{-31} \text{ kg}$
proton mass	$m_p$	$1.672\,623\,1 \times 10^{-27} \text{ kg}$
fine structure constant, $\mu_0 c e^2 / 2h$	$\alpha$	$7.297\,353\,08 \times 10^{-3}$
inverse fine-structure constant	$1/\alpha$	137.035 989 5
Rydberg constant, $m_e c \alpha^2 / 2h$	$R_y, R_\infty$	$10\,973\,731.534 \text{ m}^{-1}$
Bohr radius, $\alpha / 4\pi R_\infty$	$a_0$	$0.529\,177\,249 \times 10^{-10} \text{ m}$
Hartree energy, $e^2 / 4\pi \epsilon_0 a_0 = 2R_\infty h c$ in eV, $E_h/e$	$E_h$	$4.359\,748\,2 \times 10^{-18} \text{ J}$ 27.211 396 1 eV
Compton wavelength, $h/m_e c$	$\lambda_C$	$2.426\,310\,58 \times 10^{-12} \text{ m}$
classical electron radius, $\alpha^2 a_0$	$r_e$	$2.817\,940\,92 \times 10^{-15} \text{ m}$
Bohr magneton, $eh/4\pi m_e$	$\mu_B$	$9.274\,015\,4 \times 10^{-24} \text{ J/T}$
nuclear magneton, $eh/4\pi m_p$	$\mu_N$	$5.050\,786\,6 \times 10^{-27} \text{ J/T}$
electron magnetic moment	$\mu_e$	$9.284\,770\,1 \times 10^{-24} \text{ J/T}$
magnetic moment anomaly, $\mu_e / \mu_B - 1$	$a_e$	$1.159\,653\,193 \times 10^{-3}$
electron g factor, $2(1 + a_e)$	$g_e$	2.002 319 304 386
proton gyromagnetic ratio	$\gamma_p$	$2.675\,221\,28 \times 10^8 \text{ s}^{-1} \text{T}^{-1}$
Avogadro constant	$N_A$	$6.022\,136\,7 \times 10^{23} \text{ mol}^{-1}$
Boltzmann constant, $R/N_A$	$k$	$1.380\,658 \times 10^{-23} \text{ J/K}$
Faraday constant, $N_A e$	$F$	96 485.309 C/mol
molar gas constant	$R$	8.314 510 J/mol K
Stefan-Boltzmann constant	$s$	$5.670\,51 \times 10^{-8} \text{ W/m}^2 \text{ K}^4$

## APPENDIX V

### Units and Conversion Factors

#### Energy $E(\text{eV})$

Multiply  $E(\text{eV})$  by  $1.6022 \times 10^{-19}$  to convert to  $E(\text{J})$

Multiply  $E(\text{eV})$  by 8065.5 to convert to  $E(\text{cm}^{-1})$

#### Photon energy $(\text{eV}) = 1.2398/\lambda_{\text{vacuum}}(\mu\text{m})$

**Linear absorption coefficient**  $\alpha (\text{cm}^{-1}) = (4\pi n \times 10^4/\lambda)k$ , where  $n$  is the index of refraction of the material, the wavelength  $\lambda$  is in microns ( $\mu\text{m}$ ), and  $k$  is the complex index of refraction.

#### Two-photon absorption coefficient $\beta (\text{m/W})$

$\beta (\text{m/W}) = (N/E)\sigma^2$ , where  $N$  is the number density of molecules per  $\text{cm}^3$ ,  $E$  is the photon energy (J),  $\sigma^2$  is the two-photon absorption cross section ( $\text{cm}^4 \text{ s/molecule}$ ).

Multiply  $\beta (\text{m/W})$  by  $10^{-9}$  to convert to the CGS system ( $\text{cal/cm s/erg}$ )

#### Nonlinear index of refraction $\gamma (\text{m}^2/\text{W})$

Multiply  $\gamma (\text{m}^2/\text{W})$  by  $2.386 \times 10^6 n$  to convert to the esu system, where  $n$  is the index of refraction of the material.

$$n_2[\text{cm}^3/\text{erg}] = 238.7n [\text{cm}^2/\text{W}]$$

#### Linear electrooptic coefficient $r (\text{m/V})$

Multiply  $r (\text{m/V})$  by  $2.9979 \times 10^4$  to convert to the CGS system ( $\text{cm/statvolt}$ )

#### Kerr constant $B (10^{-16} \text{ m V}^2)$

Multiply  $B (10^{-16} \text{ m V}^2)$  by  $8.988 \times 10^6$  to convert to the CGS system ( $\text{cm/statvolt}^2$ )

#### Verdet constant $V (\text{rad/T m})$

Multiply  $V (\text{rad/T m})$  by  $3.438 \times 10^{-3}$  to convert to the CGS system ( $\text{min/Oe cm}$ )

#### Temperature $T(\text{K})$

$$\text{Temperature } T(^{\circ}\text{C}) = T(\text{K}) - 273.15$$

#### Specific heat capacity $c_p (\text{J/kg K})$

Multiply  $c_p (\text{J/kg K})$  by  $2.388 \times 10^{-4}$  to convert to the CGS system ( $\text{cal/g K}$ )

#### Thermal conductivity $\kappa (\text{W/m K})$

Multiply  $\kappa (\text{W/m K})$  by  $2.388 \times 10^{-3}$  to convert to the CGS system ( $\text{cal/cm s K}$ )

#### Hardness (Knoop or Vickers)

$$1 \text{ kgf/mm}^2 = 9.8066 \text{ N/mm}^2$$

#### Pressure, mechanical stress (Pa)

$$1 \text{ Pa} = 1 \text{ N/m}^2 = 1 \text{ kg/m s}^2$$

$$10^5 \text{ Pa} = 1 \text{ bar}$$

$$1 \text{ psi} = 6.9 \times 10^3 \text{ Pa}$$
